INTRODUCCION

EXPLICACION DE LOS VALORES CONTENIDOS EN LOS CUADROS ESTADISTICOS

La presente publicación Serie B, 3a. Sección, 1a. Parte de los Anales Hidrológicos de la Dirección General contiene la distribucción de las lluvias caidas en todo el país durante el período comprendido entre los años 1928 y 1937 inclusive. Los datos correspondientes a 2.300 estaciones aproximadamente, están expresadas en milímetros y décimos, en totales mensuales y anuales, por año, por provincia o territorio y por estación.

Los totales mensuales son el resultado de la suma de los datos provenientes de la observación diaria a las 8 horas, que están archivados en la División Pluviométrica a disposición del público y que no se publican por razones de extensión.

A continuación del nombre de la estación se han consignado las iniciales de las entidades a cargo de quienes están las observaciones; ferrocarriles, en su gran mayoría, figurando después estaciones meteorológicas, oficinas de Correos y Telecomunicaciones, Telégrafos Provinciales, Gendarmería Nacional, particulares etc.

El número total de pluviómetros actualmente en funcionamiento es de alrededor de 3.500, habiéndose publicado únicamente los datos de una estación p r localidad.

Mapas pluviométricos anuales

Con los totales anuales se han confeccionado 10 mapas, que figuran al final de cada año. Sobre estos mapas se ha efectuado una prolija depuración de datos por medio del trazado de isohietas, líneas representativas de igual cantidad de precipitaciones el que ha permitido individualizar los errores y su corrección correspondiente. Estas isohietas se han trazado de 200 en 200 milímetros, considerando como conveniente su separación, dado el tamaño de los mapas. Con el objeto de hacer figurar la isohieta de 1000 milímetros, se la ha trazado después de la de 900. Entre cada dos isohietas consecutivas se han hecho distintos tipos de rayado para poder establecer con más facilidad la precipitación que corresponde a las distintas zonas del país.

Los valores de los distintos tipos de rayado están indicados en el cuadro de referencias.

Las zonas que están en blanco en algunos mapas es debido a la falta de datos o a la deficiencia de ellos, lo que no ha permitido el trazado de las isohietas.

La región de altas precipitaciones, superiores a los 1000 milímetros en la cordillera del Neuquén, donde no hay estaciones pluviométricas, ha sido delimitada con los datos de los nivómetros totalizadores instalados en la misma

Para obtener el valor de la precipitación en un punto determinado, debe interpolarse linealmente entre las dos isohietas que lo comprenden o bien entre una isohieta y un punto cuya precipitación se conoce.

OMISION

En la página 60 se ha omitido la siguiente linea, que debe leerse inmediatamente después de la décimotercera (Jujuy, Met.):

La Mendieta, F.C.N.A.	100,0	171,0	116,0	73,0	8,0	10,0	11,0	0,0	0,0	21,0	58,0	74,0	642,0

TRASPOSICION

En la página 124, después de Leales, C. N. A., debe leerse del modo siguiente:

Los Sarmientos	291,0	115,0	97,0	32,0	34,0	34,0	0,0	7,0	29,0	74,0	6,0	113,0	852,0
Los Ralos, C. N. A. ..	203,0	55,0	225,0	36,3	7,0	20,0	0,0	5,0	45,3	64,0	29,0	209,0	898,6

y luego sigue Lules, C. C., etcétera.
