PREFACE.

The following tables with their introductory text are a reprint of the Lambert projection tables used in the French war zone, and are issued as a supplement to a manual on Lambert's Conformal Conic Projection published by the United States Coast and Geodetic Survey. The computations published in the manual are based upon the Clarke ellipsoid of 1866. While the computations here given are based upon the Plessis ellipsoid, the differences are immaterial in the construction of any ordinary projection.

The special purpose of this supplement is to meet the requirements of those now engaged in the work of preparing maps for the use of the Army in France, as the French edition is not printed in such form as to meet our particular needs and the available supply is inadequate.

Every point on the map is referred to the intersection of latitude 55 grades north and longitude 6 grades east of Paris by rectangular coordinates in meters.

The orientation of all sectional sheets or parts of the general map, wherever located, and on any scale, conforms to the initial meridian of the origin of coordinates; the obliquity of the meridians to the margin of the sheets increasing with the distance in longitude from the origin.

Certain essential tables for the conversion of degrees, minutes, and seconds, as well as for feet, yards, and miles into their metric equivalents, and vice versa, appear at the end of this book.

SUPPLEMENT TO THE LAMBERT CONFORMAL CONIC PROJECTION WITH TWO STANDARD PARALLELS.

INTRODUCTION.

LAMBERT'S PROJECTION.

The projection is calculated for the territory included between latitudes 52° and 58°, and longitudes 2° and 10° east of Paris.

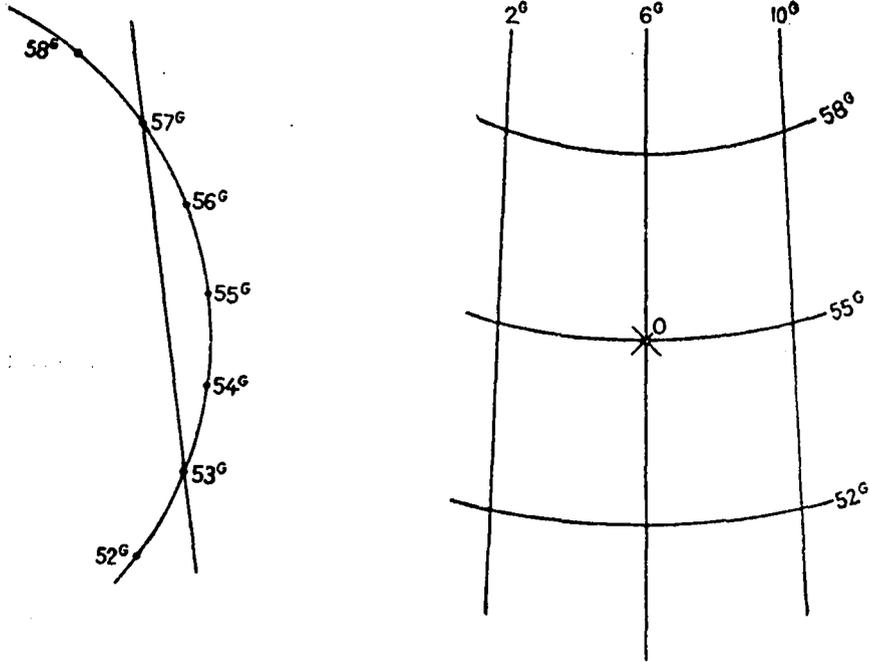

The center of the projection is defined by the intersection of the meridian 6° and parallel 55°. (See diagrams on page following.)

The calculations of all the elements were made by the First Army, using the development of the tangent cone. The same process was then used for verifying all the terms, and all these values were then reduced to Lambert's general theory of the secant cone by applying the correction $\frac{y^2}{2N_0^2}$. This term was determined on the two parallels situated two grades from the parallel of tangency, and the reduction of length which results from this is $\frac{200\ 170^2}{2 \times 6\ 388\ 482^2} = 0.000491 = \frac{1}{2037}$.

The ellipsoid adopted is called the "Plessis ellipsoid" and is the ellipsoid of the Map of France, the lengths of which are corrected by $\left(1 - \frac{0.724}{10\ 000}\right)$ to reduce them to the values used by Plessis in his calculation of the tables for the projection of the Map of France. These elements are:

CALCULATION OF THE RECTANGULAR COORDINATES.

$\alpha = \frac{p_0}{R_0} M$ (M = longitude in decigrades)

by reference to 0, $\begin{cases} x' = R \sin \alpha \\ y' = y_0' + R(1 - \cos \alpha) \end{cases}$

whence, by developing up to and including the fourth order:

$x' = p' M - B M^3$

$y' = y_0' + A M^2 - C M^4$

x' and y' have been calculated for each grade from 52° to 58° in latitude and from 0° to 4° 5' in longitude, and then each of these values has been reduced to the secant plane by the correction $\frac{1}{2037}$. Starting with the values x' and y' thus obtained, the decigrades in latitude and longitude have been calculated by interpolation.

The center of the development being $L_0 = 55^\circ$, $M_0 = 6^\circ$, in order that all the values may be positive the rectangular coordinates of the origin have been assumed as:

$x = 500\ 000$ meters $y = 300\ 000$ meters

The resulting rectangular coordinates are:

$x = 500\ 000 \pm x' \begin{cases} + \text{long. E. of origin} \\ - \text{long. W. of origin} \end{cases}$ $y = y' + 300\ 000$

The following table gives the values of x and y for the even grades:

The numerical values for the elements in grades are furnished on pages 10 to 49.

GERMAN MAPS.

For use on the German maps, the same projection has been calculated in degrees, and the numerical values for the elements are furnished on pages 50 to 72.

The origin $L_0 = 55^{\circ}$
 $M_0 = 6^{\circ}$ becomes for these maps $L_0 = 49^{\circ}30'$
 $M_0 = 25^{\circ}24'$

$$x_0 = 500\ 000; \quad y_0 = 300\ 000.$$

The tables are *identically the tables in grades*, the transformation being made by applying the formulas:

$$X = x + n\Delta'x + n'\Delta x + nn'\Delta_2x \quad Y = y + n\Delta'y + n'\Delta y + nn'\Delta_2y$$

The elements are given at intervals of 10' for longitudes, and at intervals of 6' for latitudes.

The measurement of longitudes is reckoned from the meridian of Paris; to make it agree with the notation of the German maps, it is merely necessary to add 20°.

In order to refer longitudes measured on the German map to the meridian of Paris, $20^{\circ} 00' 13''.31$ must be subtracted from them. In the tables no account is taken of the $13''.31$ because this difference is theoretical and is variable according to the locality, if several common points of the two triangulations are compared. Besides this, the fact that we do not possess the German triangulation of the region in question, necessitates the use of whatever we possess of the French triangulation. This triangulation calculated in grades will have its values for x and y determined by means of the table in grades, and these values will then exactly correspond with those of the table in degrees.

UNITED STATES COAST AND GEODETIC SURVEY.

GRADES TO DEGREES, MINUTES, AND SECONDS.

[In the conversion of the decimal system of grades to the sexagesimal system of degrees, minutes, and seconds—first 8 columns—the seconds column is omitted, the conversion being complete without it; thus, 101 grades=90° 54' (or 90° 54' 00'').]
