Distribution and Abundance of Fishes and Invertebrates in North Atlantic Estuaries

Introduction

This report presents information on the spatial and temporal distribution, relative abundance, and life history characteristics of 58 species of fishes and invertebrates (Table 1) in 17 estuaries in Massachusetts, New Hampshire, and Maine. Its purpose is to disseminate data developed from the National Oceanic and Atmospheric Administration's (NOAA) Estuarine Living Marine Resources (ELMR) program (see inside front cover). The ELMR program is conducted by the Biogeographic Characterization Branch of the Strategic Environmental Assessments (SEA) Division. The primary data compiled include the presence, distribution, and relative abundance of each species and the time period it utilizes each estuary. The data and framework presented are illustrative of the nationwide ELMR program (Monaco et al. 1990, Nelson et al. 1991, Nelson 1992, Stone et al. 1994).

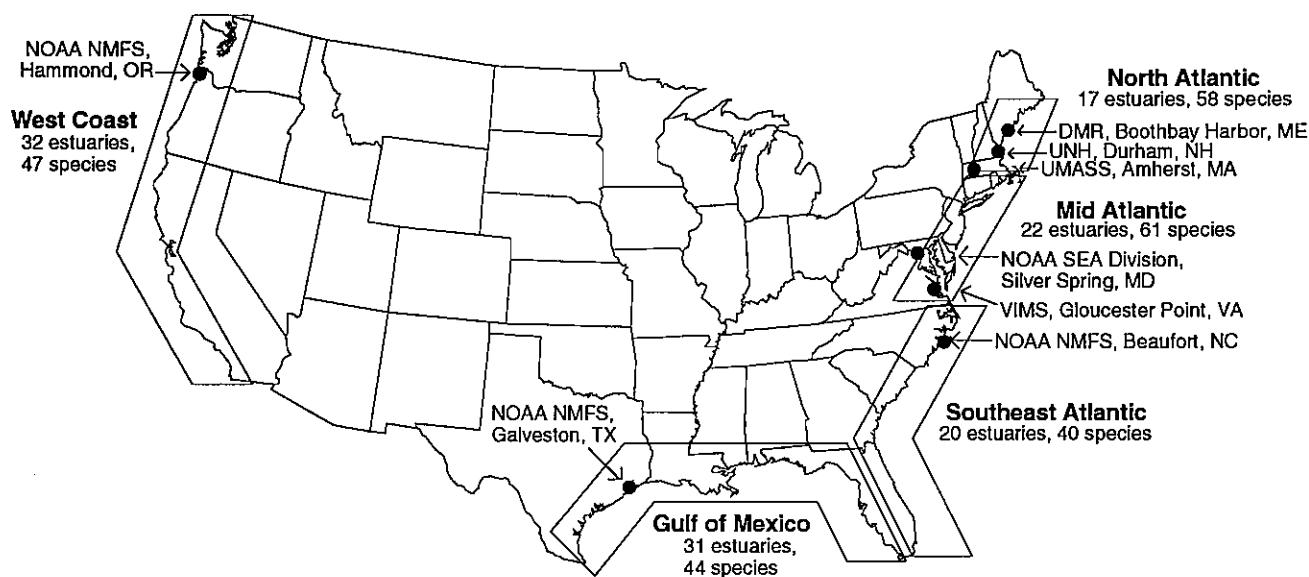

The objective of the ELMR program is to develop a consistent data base on the presence, distribution, relative abundance, and life history characteristics of ecologically and economically important fishes and invertebrates in the nation's estuaries. The data base is divided into five study regions (Figure 1) and contains the monthly relative abundance of each species' life stage by estuary for three salinity zones (seawater, mixing, and tidal fresh) identified in NOAA's National Estuarine Inventory (NEI) Data Atlas-Volume I and supplement (NOAA 1985). The nationwide data base contains information for 135 fish and invertebrate species found in 122 estuaries.

Rationale

Estuaries are among the most productive natural systems and have been shown to be important nursery areas that provide food, refuge from predation, and valuable habitat for many species (Tyler 1971, MacDonald et al. 1984, Langton et al. 1989, Day et al. 1989, Ayvazian et al. 1992). Estuarine organisms that support important commercial and recreational fisheries include bivalves, decapods, and a variety of finfish. In spite of the well-documented importance of estuaries to fishes and invertebrates, few consistent and comprehensive data bases exist that allow examinations of the relationships between estuarine species found in or among groups of estuaries. Furthermore, much of the distribution and abundance information for estuarine-dependent species (i.e., species that require estuaries during their life cycle) is for offshore life stages and does not adequately describe estuarine distributions (NOAA 1990, Darnell et al. 1983).

Only a few sampling programs (e.g., Massachusetts Division of Marine Fisheries, Maine Department of Marine Resources inshore trawl surveys) collect fishes and invertebrates with identical methods across groups of estuaries within a region (Howe et al. 1991, MDMR 1993). Therefore, most existing estuarine fisheries data cannot be compared among estuaries because of the variable sampling strategies. In addition, existing research programs do not focus on how groups of estuaries may be important for regional fishery management, and few compile information for species having little or no economic value.

Figure 1. ELMR study regions and regional research institutions.

Because different life stages of many species use both estuarine and marine habitats, information on the distribution, abundance, temporal utilization and life history characteristics are needed to understand the coupling of estuarine, nearshore, and offshore habitats. Consequently, the ELMR program was developed to integrate fragments of information on these species and their associated habitats into a useful, comprehensive and consistent format. A national data base of this type does not presently exist. Results from this program will complement NOAA efforts to develop a national estuarine assessment capability (NOAA 1985), identify information gaps, and assess the content and quality of existing estuarine fisheries data. In addition the ELMR data will be integrated with information from NOAA's East Coast of North America Strategic Assessment Project to provide consistent species distribution data in marine, as well as estuarine, environments (NOAA, 1991).

Data Collection and Organization

Compiling consistent data nationwide limits the amount of information that may be collected for each species and estuary. It would also be both time and cost-prohibitive to map each species by life stage for each estuary (Monaco 1986). The NOAA framework enables a consistent compilation and organization of all available data on the distribution and abundance of fishes and invertebrates in estuaries. Figure 2 summarizes the major steps taken to collect and organize this information. The initial steps were selection of the estuaries and species to be studied.

Selection of estuaries. Thirteen North Atlantic estuaries were selected from the National Estuarine Inventory (NEI) Data Atlas-Volume I (NOAA 1985) and, after discussions with several regional researchers, four

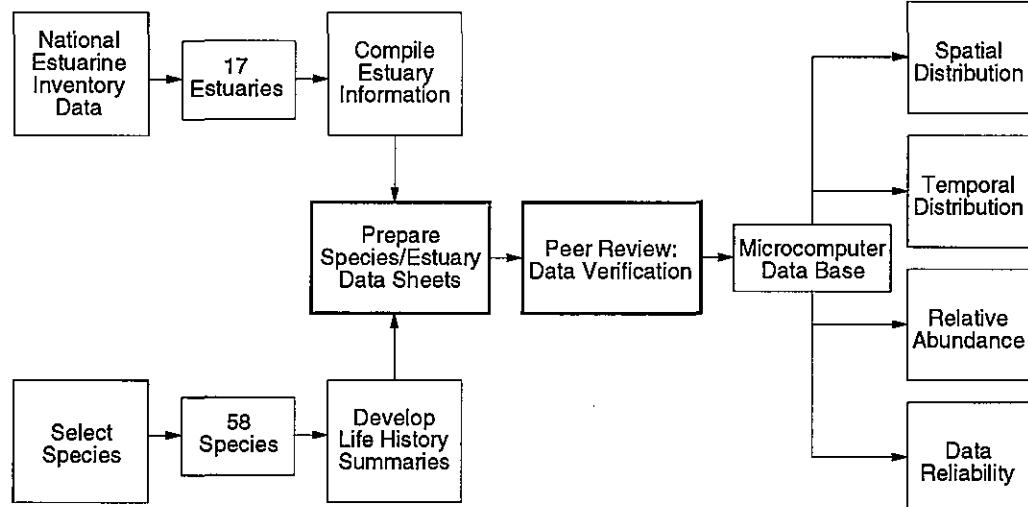

additional estuaries were included. The locations of the 17 selected estuaries and their associated salinity zones are shown in Figure 3.

Data on the spatial and temporal distributions of species were compiled for the tidal fresh (0.0-0.5 parts per thousand (ppt)), mixing (0.5-25.0 ppt), and seawater (>25 ppt) zones delineated for each estuary in the NEI. A representative map and data table for Penobscot Bay from the NEI Data Atlas is shown in Appendix 1. Each salinity zone is represented in 12 of the 17 North Atlantic estuaries, but for the purposes of this study 5 estuaries are considered to be missing at least one of the aforementioned zones (Figure 3). Salinity zones that are only seasonally present or are extremely small (i.e., <1 km²) were generally omitted from this large-scale assessment (see NOAA 1985 for a discussion of zone delineation). Refer to Appendix 2, *Estuary notes*, for the rationale for additions to the NEI and a discussion of unique features of estuaries in the Gulf of Maine region.

Selection of species. ELMR personnel and local reviewers used the following four criteria, together with data availability, to select 58 species for inclusion in the ELMR data base (Table 1). The common and scientific names of all species are those adopted by the American Fisheries Society (Turgeon et al. 1988, Williams et al. 1988, Robins et al. 1991):

- Commercial value—determined by review of catch data and value statistics from NMFS and state agencies, e.g., Atlantic cod (*Gadus morhua*) and softshell clam (*Mya arenaria*).
- Recreational value—determined by relative importance in recreational fisheries that may or may not be commercially exploited. Recreational species were

Figure 2. Major steps taken to complete the North Atlantic ELMR study.

determined by consulting regional experts and NMFS reports, e.g., Atlantic salmon (*Salmo salar*) and striped bass (*Morone saxatilis*).

- Indicator of environmental stress—determined from the literature, discussions with fisheries experts, and from monitoring programs such as NOAA's National Status and Trends Program (O'Connor 1990). These species are typically molluscs or demersal fishes that consume benthic invertebrates or have a strong association with bottom sediments, e.g., blue mussel (*Mytilus edulis*) and winter flounder (*Pleuronectes americanus*). Their physiological disorders, morphological abnormalities, and bioaccumulation of contaminants, such as heavy metals, indicate exposure to environmental pollution and/or stress.
- Ecological value—based on several attributes including trophic level, relative abundance, and importance as a key predator or prey species, e.g., silversides (*Menidia* species) and sevenspine bay shrimp (*Crangon septemspinosa*).

For the majority of species considered in this report, growth and development involve a direct progression through several distinct life stages. Accordingly, the ELMR program has compiled information based on five "typical" life stages: adult (A), spawning adult (S), juvenile (J), larvae (L) and egg (E). *Adults* were defined as reproductively mature individuals while *juveniles*

were defined as immature but otherwise similar to adults. Species with a larval stage typically undergo metamorphosis to the juvenile stage, hence larvae usually differ from juveniles and adults in form. In addition, most species rely on external fertilization via spawning, when gametes combine externally after being released by males and/or females. Therefore, *spawning adults* were defined as those releasing eggs or sperm and *larvae* and *eggs* included most early life history stages. The complex life histories of some species, and the subsequent difficulty in placing them into a comprehensive classification scheme, required some deviation from this general classification. For example, mating (M) or parturition (P) replaced spawning (S) for some species (e.g., green crab and spiny dogfish respectively) because the reproductive mode of certain species differs from the norm in that there is internal fertilization of eggs, ovoviparity, delayed fertilization, etc. In addition, egg and/or larval stages are not applicable for certain species because the stage(s) is either absent or better defined by the presence of gravid females. Refer to Appendix 3, *Species life history notes*, for a discussion of these deviations for individual species. This section identifies cases where the ELMR program has considered alternate life stages, cases in which two or more species are considered as a single unit, comments on specific habitat preferences and behaviors, and other pertinent life history information.

Figure 3. ELMR North Atlantic estuaries and associated salinity zones.

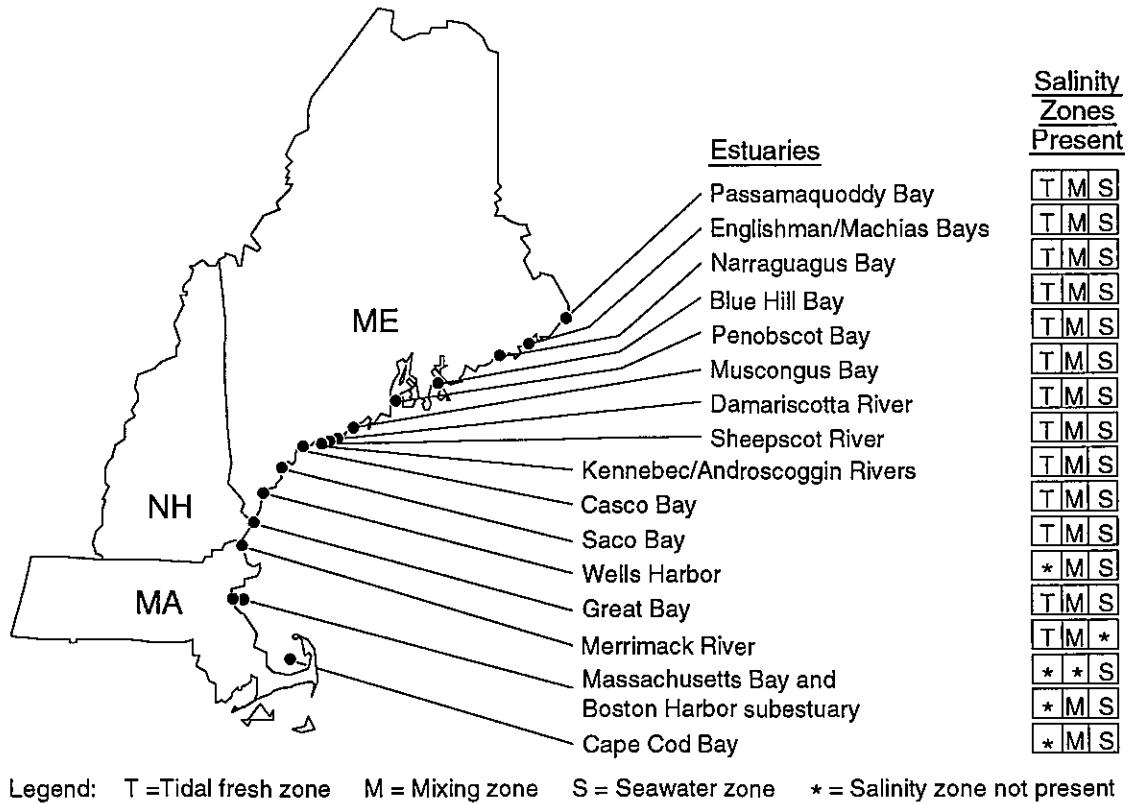

Table 1. ELMR North Atlantic species.

<u>Common name</u>	<u>Scientific name</u>	<u>Family</u>
Blue mussel	<i>Mytilus edulis</i>	Mytilidae
Sea scallop	<i>Placopecten magellanicus</i>	Pectinidae
American oyster	<i>Crassostrea virginica</i>	Ostreidae
Northern quahog	<i>Mercenaria mercenaria</i>	Veneridae
Softshell clam	<i>Mya arenaria</i>	Myidae
Daggerblade grass shrimp	<i>Palaemonetes pugio</i>	Palaemonidae
Northern shrimp	<i>Pandalus borealis</i>	Pandalidae
Sevenspine bay shrimp	<i>Crangon septemspinosa</i>	Crangonidae
American lobster	<i>Homarus americanus</i>	Nephropidae
Jonah crab	<i>Cancer borealis</i>	Cancridae
Atlantic rock crab	<i>Cancer irroratus</i>	Cancridae
Green crab	<i>Carcinus maenas</i>	Portunidae
Green sea urchin	<i>Strongylocentrotus droebachiensis</i>	Strongylocentrotidae
Spiny dogfish	<i>Squalus acanthias</i>	Squalidae
Skates	<i>Raja</i> species	Rajidae
Shortnose sturgeon	<i>Acipenser brevirostrum</i>	Acipenseridae
Atlantic sturgeon	<i>Acipenser oxyrinchus</i>	Acipenseridae
American eel	<i>Anguilla rostrata</i>	Anguillidae
Blueback herring	<i>Alosa aestivalis</i>	Clupeidae
Alewife	<i>Alosa pseudoharengus</i>	Clupeidae
American shad	<i>Alosa sapidissima</i>	Clupeidae
Atlantic menhaden	<i>Brevoortia tyrannus</i>	Clupeidae
Atlantic herring	<i>Clupea harengus</i>	Clupeidae
Rainbow smelt	<i>Osmerus mordax</i>	Osmeridae
Atlantic salmon	<i>Salmo salar</i>	Salmonidae
Atlantic cod	<i>Gadus morhua</i>	Gadidae
Haddock	<i>Melanogrammus aeglefinus</i>	Gadidae
Silver hake	<i>Merluccius bilinearis</i>	Gadidae
Atlantic tomcod	<i>Microgadus tomcod</i>	Gadidae
Pollock	<i>Pollachius virens</i>	Gadidae
Red hake	<i>Urophycis chuss</i>	Gadidae
White hake	<i>Urophycis tenuis</i>	Gadidae
Mummichogs	<i>Fundulus heteroclitus</i>	Cyprinodontidae
Silversides	<i>Menidia</i> species	Atherinidae
Fourspine stickleback	<i>Apeltes quadratus</i>	Gasterosteidae
Threespine stickleback	<i>Gasterosteus aculeatus</i>	Gasterosteidae
Ninespine stickleback	<i>Pungitius pungitius</i>	Gasterosteidae
Northern pipefish	<i>Syngnathus fuscus</i>	Syngnathidae
Northern searobin	<i>Prionotus carolinus</i>	Triglidae
Grubby	<i>Myoxocephalus aenaeus</i>	Cottidae
Longhorn sculpin	<i>Myoxocephalus octodecemspinosis</i>	Cottidae
Shorthorn sculpin	<i>Myoxocephalus scorpius</i>	Cottidae
White perch	<i>Morone americana</i>	Percichthyidae
Striped bass	<i>Morone saxatilis</i>	Percichthyidae
Bluefish	<i>Pomatomus saltatrix</i>	Pomatomidae
Scup	<i>Stenotomus chrysops</i>	Sparidae
Tautog	<i>Tautoga onitis</i>	Labridae
Cunner	<i>Tautogolabrus adspersus</i>	Labridae
Ocean pout	<i>Macrozoarces americanus</i>	Zoarcidae
Rock gunnel	<i>Pholis gunnellus</i>	Pholidae
American sand lance	<i>Ammodytes americanus</i>	Ammodytidae
Atlantic mackerel	<i>Scomber scombrus</i>	Scombridae
Butterfish	<i>Peprilus triacanthus</i>	Stromateidae
Windowpane flounder	<i>Scophthalmus aquosus</i>	Bothidae
American plaice	<i>Hippoglossoides platessoides</i>	Pleuronectidae
Winter flounder	<i>Pleuronectes americanus</i>	Pleuronectidae
Yellowtail flounder	<i>Pleuronectes ferrugineus</i>	Pleuronectidae
Smooth flounder	<i>Pleuronectes putnami</i>	Pleuronectidae

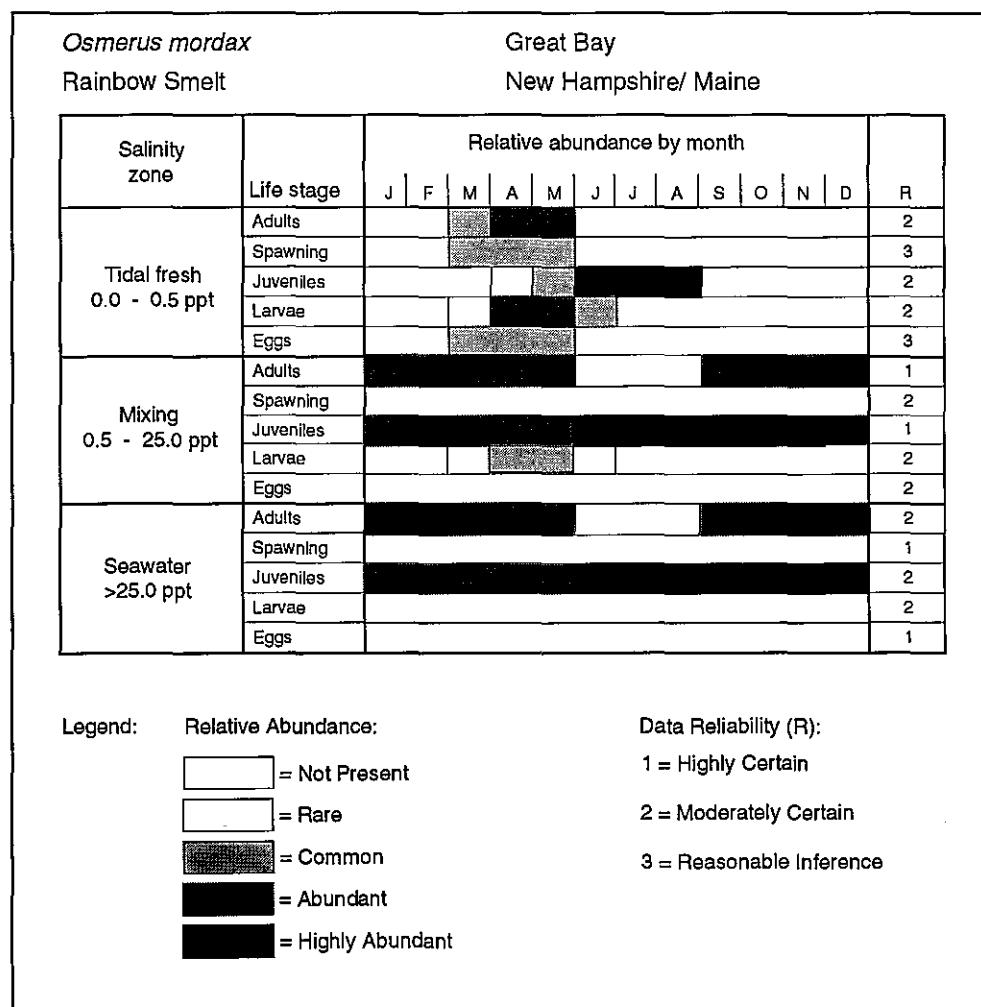

Data sheet development. A data sheet was developed for each species in each estuary to facilitate the review and presentation of the information. Data compiled for each species/life stage included: 1) the salinity zone it occupies (seawater, mixing, tidal fresh), 2) its monthly distribution in those zones, and 3) its relative abundance in those zones. Figure 4 depicts the data sheet for rainbow smelt (*O. mordax*) in Great Bay, NH/ME. Project staff developed these data sheets by conducting exhaustive literature searches, and examining published and unpublished data sets. To complement the information from these quantitative studies, regional and local biologists were asked for their knowledge of estuary/species-specific spatial and temporal distribution patterns and relative abundance levels based upon their experience and research. The final level of relative abundance assigned to a species was determined from the available data and expert review.

The abundance of a species was assessed relative to that of the same life stage of other species with similar behaviors (e.g., pelagic, demersal), gear susceptibilities, and/or habitats. Based upon these similarities, it

was possible to derive several "guilds" from the North Atlantic ELMR species list and meaningfully assess the relative abundance of species within each guild (Table 2). For example, bluefish were compared to other pelagic species and blue mussels were compared to other bivalves but they were not compared to each other. To rank relative abundances, ELMR staff used the following categories:

- Not present—species or life history stage not found, questionable data as to identification of species, and/or recent loss of habitat or environmental degradation suggests absence.
- No information available—no existing data available, and after expert review it was determined that not even an educated guess would be appropriate. This category was also infrequently used if the limited data available were extremely conflicting and/or contradictory (e.g., white hake spawning); in these cases, *no information available* actually describes a situation where the available information was indecipherable.

Figure 4. Example of a species/estuary data sheet: Rainbow smelt in Great Bay.

- Rare—species is definitely present but not frequently encountered.
- Common—species is frequently encountered but not in large numbers; does not imply a uniform distribution over a specific salinity zone.
- Abundant—species is often encountered in substantial numbers relative to other species with similar life modes.
- Highly abundant—species is numerically dominant relative to other species with similar life modes.

Table 2. Classification of ELMR North Atlantic species by guild.

<i>Sessile Invertebrates</i>	<i>Shallow Water Fishes</i>
Blue mussel	Mummichog
Sea scallop	Silversides
American oyster	Fourspine stickleback
Northern quahog	Threespine stickleback
Softshell clam	Ninespine stickleback
Green sea urchin	Northern pipefish
	American sand lance
<i>Shrimps</i>	<i>Demersal Fishes</i>
Daggerblade grass shrimp	Spiny dogfish
Northern shrimp	Skates
Sevenspine bay shrimp	Shortnose sturgeon
<i>Large Crustaceans</i>	Atlantic sturgeon
American lobster	American eel
Jonah crab	Atlantic cod
Atlantic rock crab	Haddock
Green crab	Silver hake
<i>Pelagic Fishes</i>	Atlantic tomcod
Blueback herring	Pollock
Alewife	Red hake
American shad	White hake
Atlantic menhaden	Northern searobin
Atlantic herring	Grubby
Rainbow smelt	Longhorn sculpin
Atlantic salmon	Shorthorn sculpin
White perch	Scup
Striped bass	Tautog
Bluefish	Cunner
Atlantic mackerel	Ocean pout
Butterfish	Rock gunnel
	Windowpane flounder
	American plaice
	Winter flounder
	Yellowtail flounder
	Smooth flounder

The data presented here represent relative abundance levels within a specific estuary; relative abundance levels across all Gulf of Maine estuaries could **not** be determined in this analysis. Nevertheless, the relative abundance data shown in the data summaries depict the best available information that could be synthesized from agency reports, academic studies, and expert reviews (see *Data Content and Quality* section, below).

Data verification. For many well-studied species (e.g., winter flounder, American lobster), quantitative data were used to estimate spatial and temporal distributions. For other species, however, reliable quantitative data were limited. Therefore, nearly all data sheets were submitted to panels of local researchers, managers, and technicians for peer review based upon their knowledge of individual species within an estuary. Approximately one and a half years were required to develop the 986 data sheets (Figure 4) and consult with more than 72 scientists and managers at 33 institutions (see Appendix 4 for names and affiliations). As stated previously, this review process complemented the information gathered from the literature and published data sets compiled by NOAA.

Results

Presence/absence of ELMR species in North-Atlantic estuaries. Table 3 (p. 8-9) was developed to readily convey the occurrence of each of the 58 ELMR species in each of the 17 North Atlantic estuaries. This table depicts the highest relative abundance of the adult or juvenile life stage of each species, in any month, in any salinity zone within each estuary. The spawning, egg, and larval life stage categories are not considered. This table also depicts the zoogeography of species among estuaries.

Data summaries. The information compiled for each species and estuary (986 data sheets) was organized in three data summaries that begin on p. 17. Table 4 (pp. 19-49) summarizes the distribution and relative abundance (the highest level of abundance during the year in each estuary is depicted) for each species by life stage, in each estuary by salinity zone. Table 5 (pp. 51-111) summarizes the temporal distribution and relative abundance of each species by month and life stage for each estuary. This table combines data over the three salinity zones, showing the highest level of abundance for a particular life stage by month. The information shown represents the expected spatial and temporal distribution of a species in a particular estuary based upon available data.

Seasonal and geographical comparisons. To examine general abundance patterns, the numbers of species ranked as "common" or greater were counted by month and by salinity zone for the adult, juvenile, and larval life stages. In Figure 5, the numbers of species were plotted by estuary. In Figure 6, the numbers of species were averaged across estuaries and plotted by month for these life stages. Although these summaries are not statistical analyses, they do provide insights into the seasonal and geographical distribution of selected species in the estuaries:

- The number of species present appeared to be higher in some estuaries than in others (Figure 5). However, only 58 species were selected for the ELMR North Atlantic region study, and thus the species list was not comprehensive for the region. Some of the selected species occur primarily in the northern Gulf of Maine estuaries (e.g., smooth flounder, ninespine stickleback), and some occur primarily in the more southern estuaries (e.g., American oyster, scup, daggerblade grass shrimp). In addition, some estuaries and salinity zones (e.g., Wells Harbor, Damariscotta River tidal fresh) were quite small and contained relatively little habitat for several of the selected species.
- The number of larval species was higher in the southern estuaries (Cape Cod Bay, Boston Bay, Massachusetts Bay, Great Bay) than in the northern ones (Figure 5). This may have resulted, in part, from spawning activity by the more southern species (e.g., American oyster, scup, daggerblade grass shrimp) in these systems, and large seawater zones which could accommodate more of the marine spawners.
- The number of species appeared to be lowest in the tidal fresh zone (Figures 5 and 6). However, this could have been partially due to the fact that the selected ELMR species are primarily estuarine, not freshwater. Most of the ELMR species found in fresh water are diadromous, temporarily using the zone as a spawning ground or corridor to other breeding areas. In addition, the lack of systematic faunal surveys in many tidal freshwater zones contribute to this apparent lower diversity.
- Estuarine utilization by all three life stages was highest in the summer and lowest in the winter, with some notable exceptions (e.g., winter flounder, Atlantic herring) (Figure 6).
- The number of species present as larvae in the mixing and seawater zones was highest in June. The number of species present as adults or juveniles was highest in September and October (Figure 6).

Data Content and Quality

Data reliability. An important aspect of the ELMR program, especially since it is based primarily on literature and consultations, is to determine the quality of available data. The quality of available information varied between species, life stage, and estuary, due to differences in gear selectivity, difficulty in identifying larvae, difficulty in sampling various habitats, and the extent of sampling and analysis in particular studies. As a result, spatial and temporal resolution was greater in well-studied estuaries and for well-studied species. For example, a large amount of information was available on the American lobster in the seawater zone because it is highly valued both commercially and recreationally. Conversely, very little is known about smooth flounder in the tidal fresh zone. Similarly, early life history and spawning activity are often poorly documented. Except for a few species, very little data has been generated on specific habitat preferences. This is particularly true for the forage and/or non-commercial fishes and invertebrates. In addition, life history data are lacking or incomplete even for some of the commercially important and pelagic species. Given this situation, an objective of the ELMR program was to describe the quality of available data. Therefore, a deliberate effort was made to assess the data reliability so that the data base could be used appropriately. Estimates of the data reliability for each species and estuary are presented in Table 6 (pp. 113-143) of the Data Summary Tables section. Data reliability was classified using the following categories:

- Highly certain—considerable sampling data available. Distribution, behavior, and preferred habitats well documented within an estuary.
- Moderately certain—some sampling data available for an estuary. Distribution, preferred habitat, and behavior well documented in similar estuaries.
- Reasonable inference—little or no sampling data available. Information on distributions, ecology, and preferred habitats documented in similar estuaries.

Appendices 4, 5, and 6 provide a complete summary of the personal communications and primary references used so that readers can easily obtain additional information. An opportunity exists to further refine the data presented based upon additional reviews or new research findings.

Variability in space and time. Species distribution data were organized according to the salinity zone boundaries developed for each estuary in the NEI data atlas-Vol. I and supplement (NOAA 1985). However, these zones can be highly variable due to the many

Figure 5. Numbers of ELMR species (with relative abundance of common or greater) in North Atlantic estuaries, by estuary, salinity zone, and life stage.

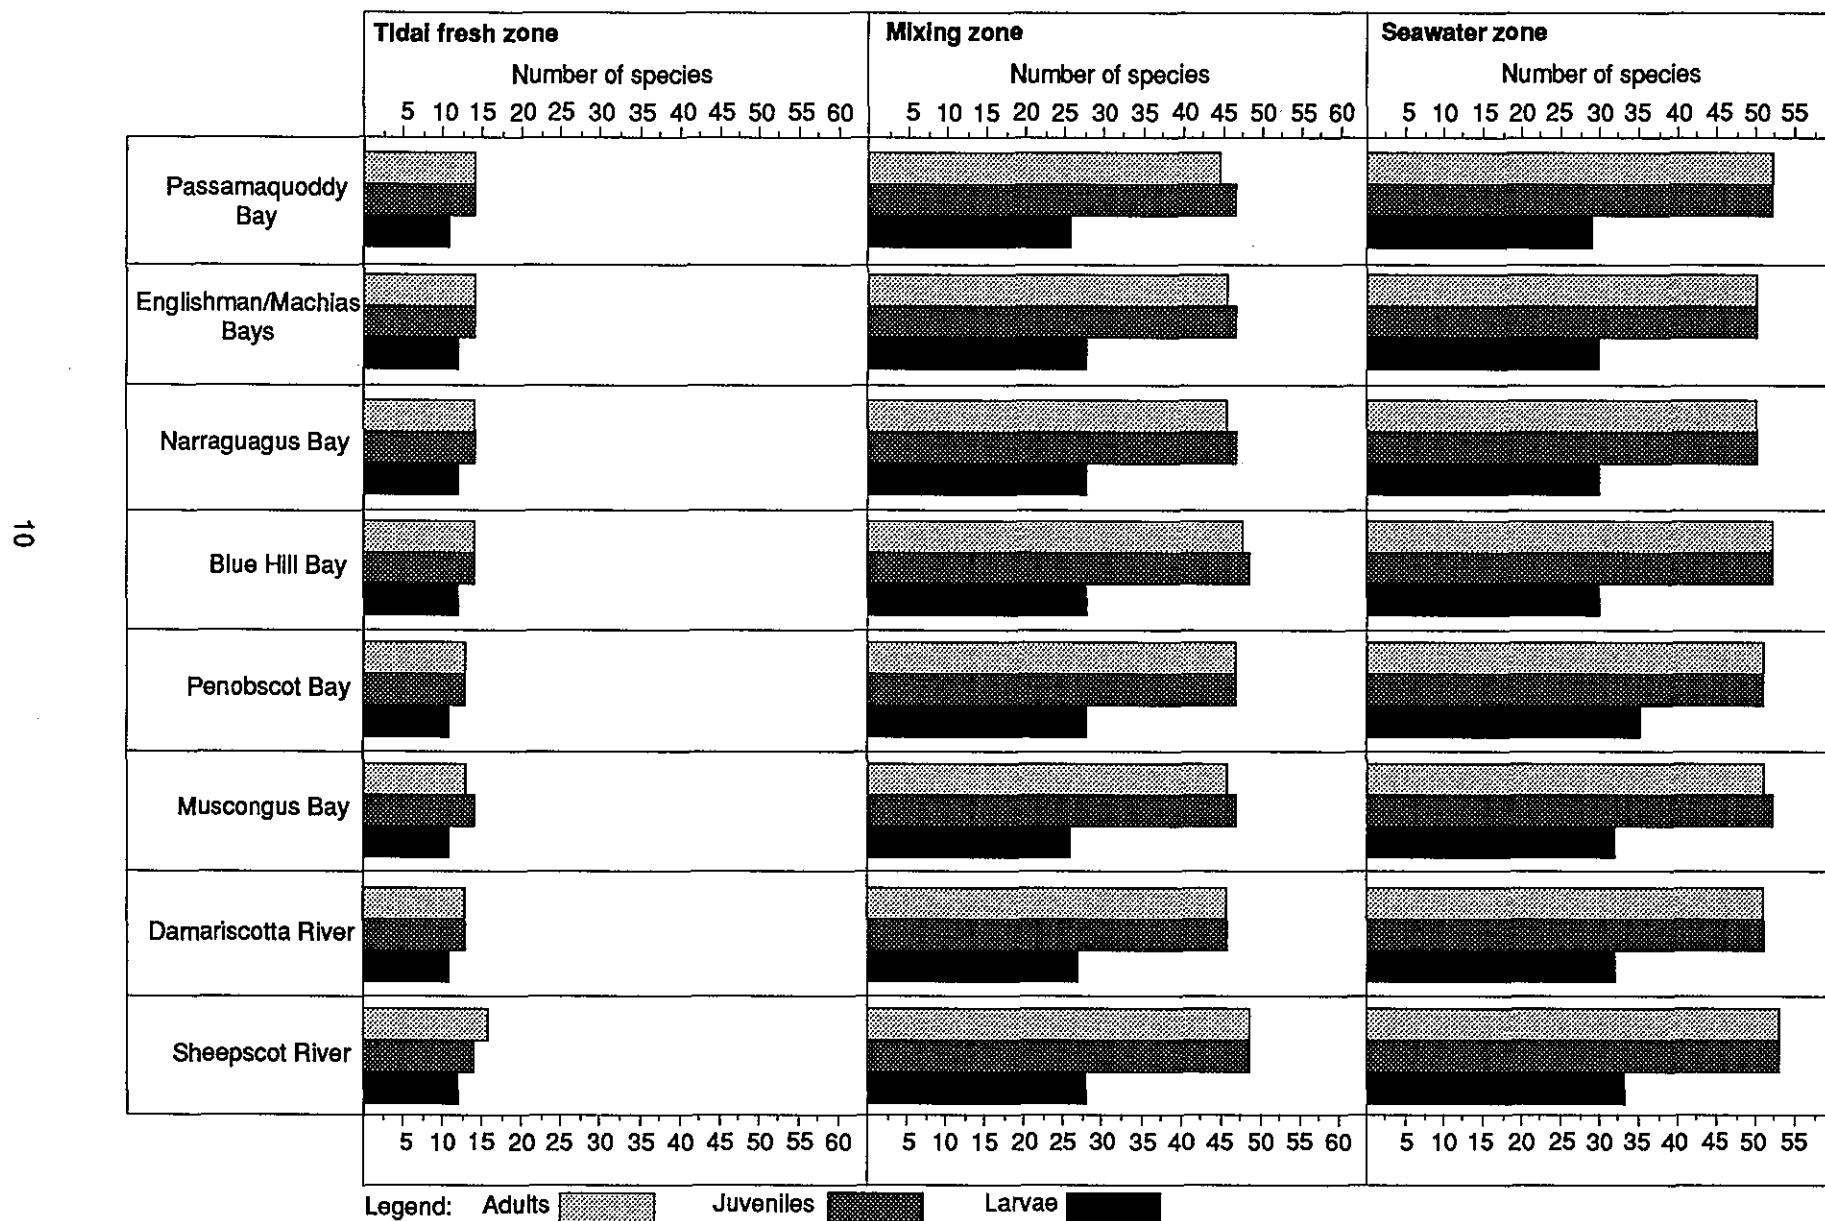

Figure 5, continued. Numbers of ELMR species (with relative abundance of common or greater) in North Atlantic estuaries, by estuary, salinity zone, and life stage.

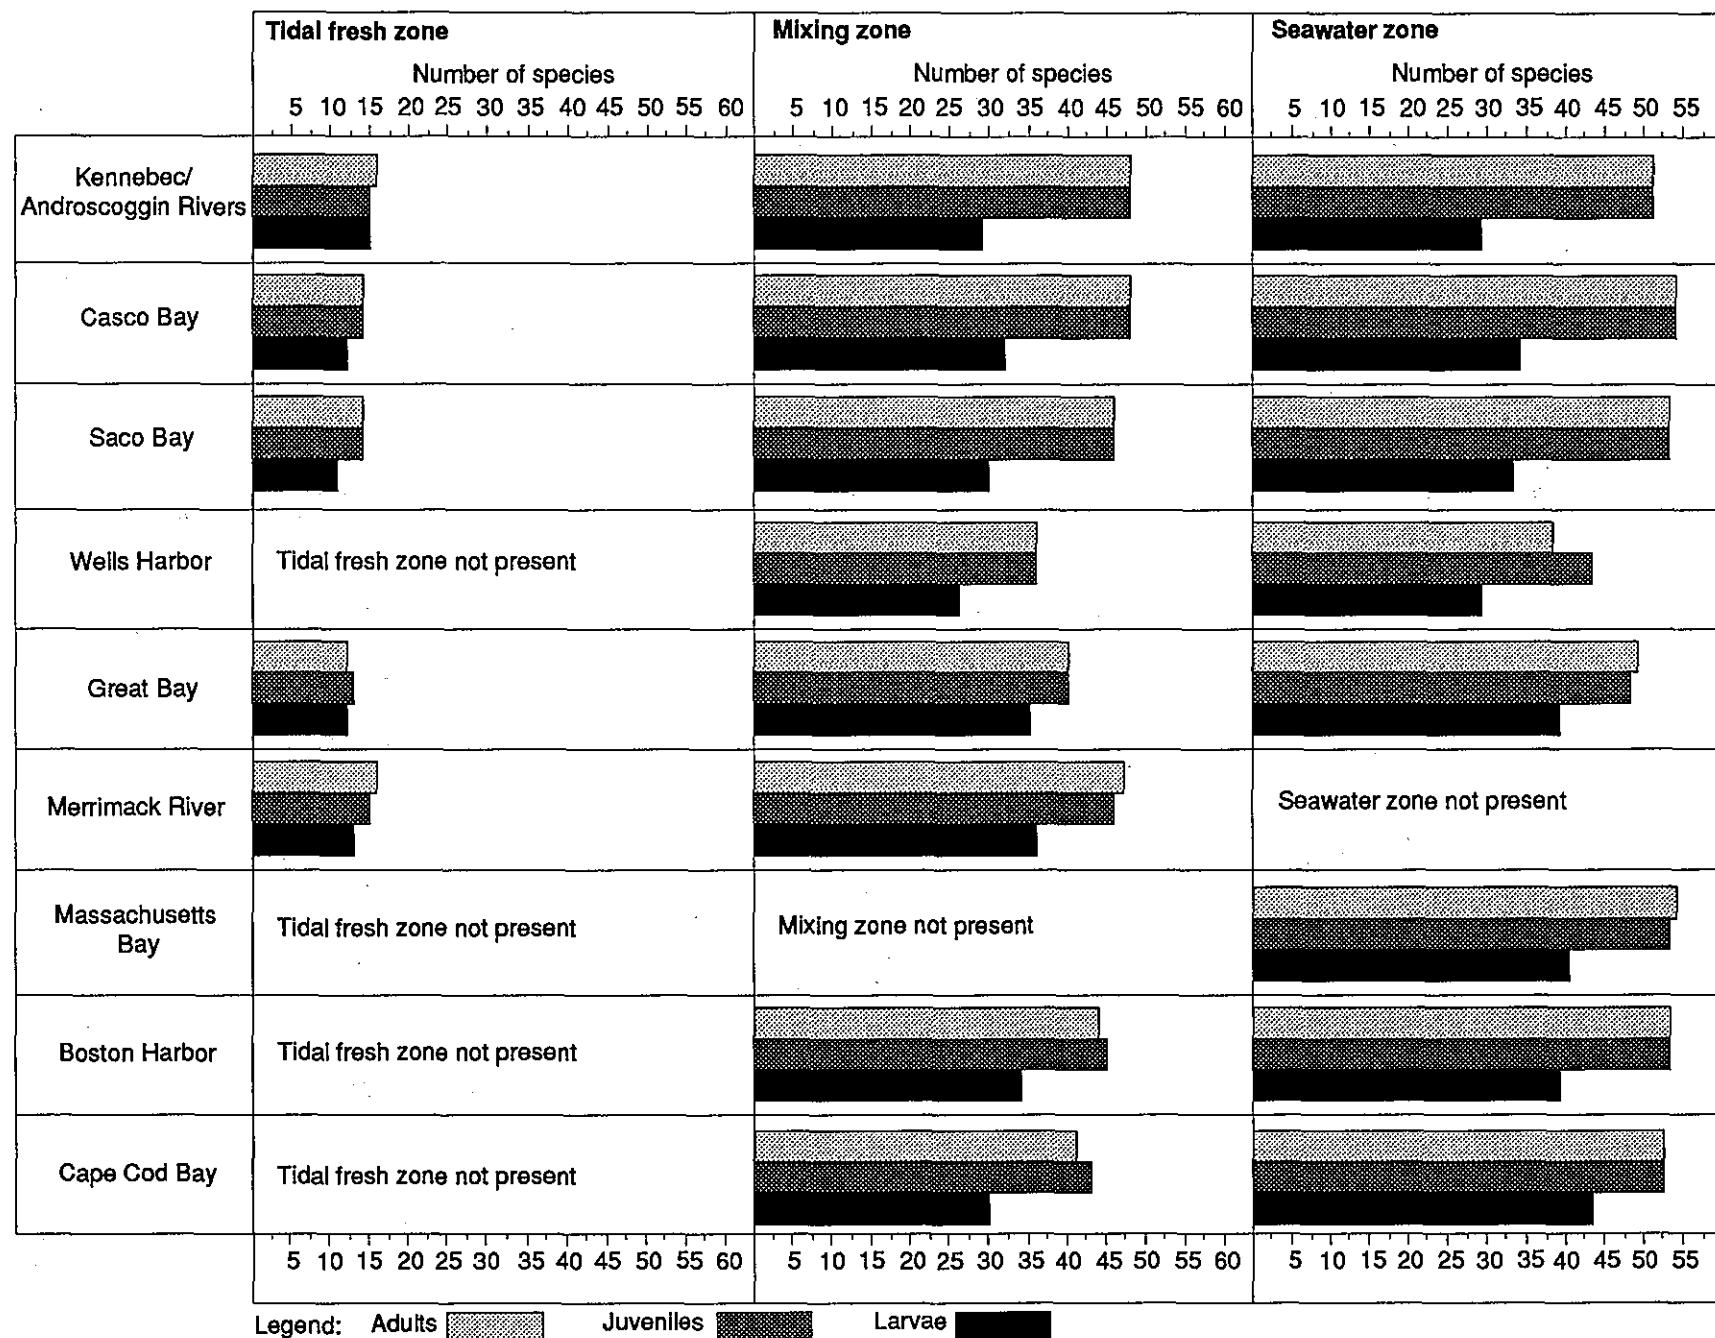

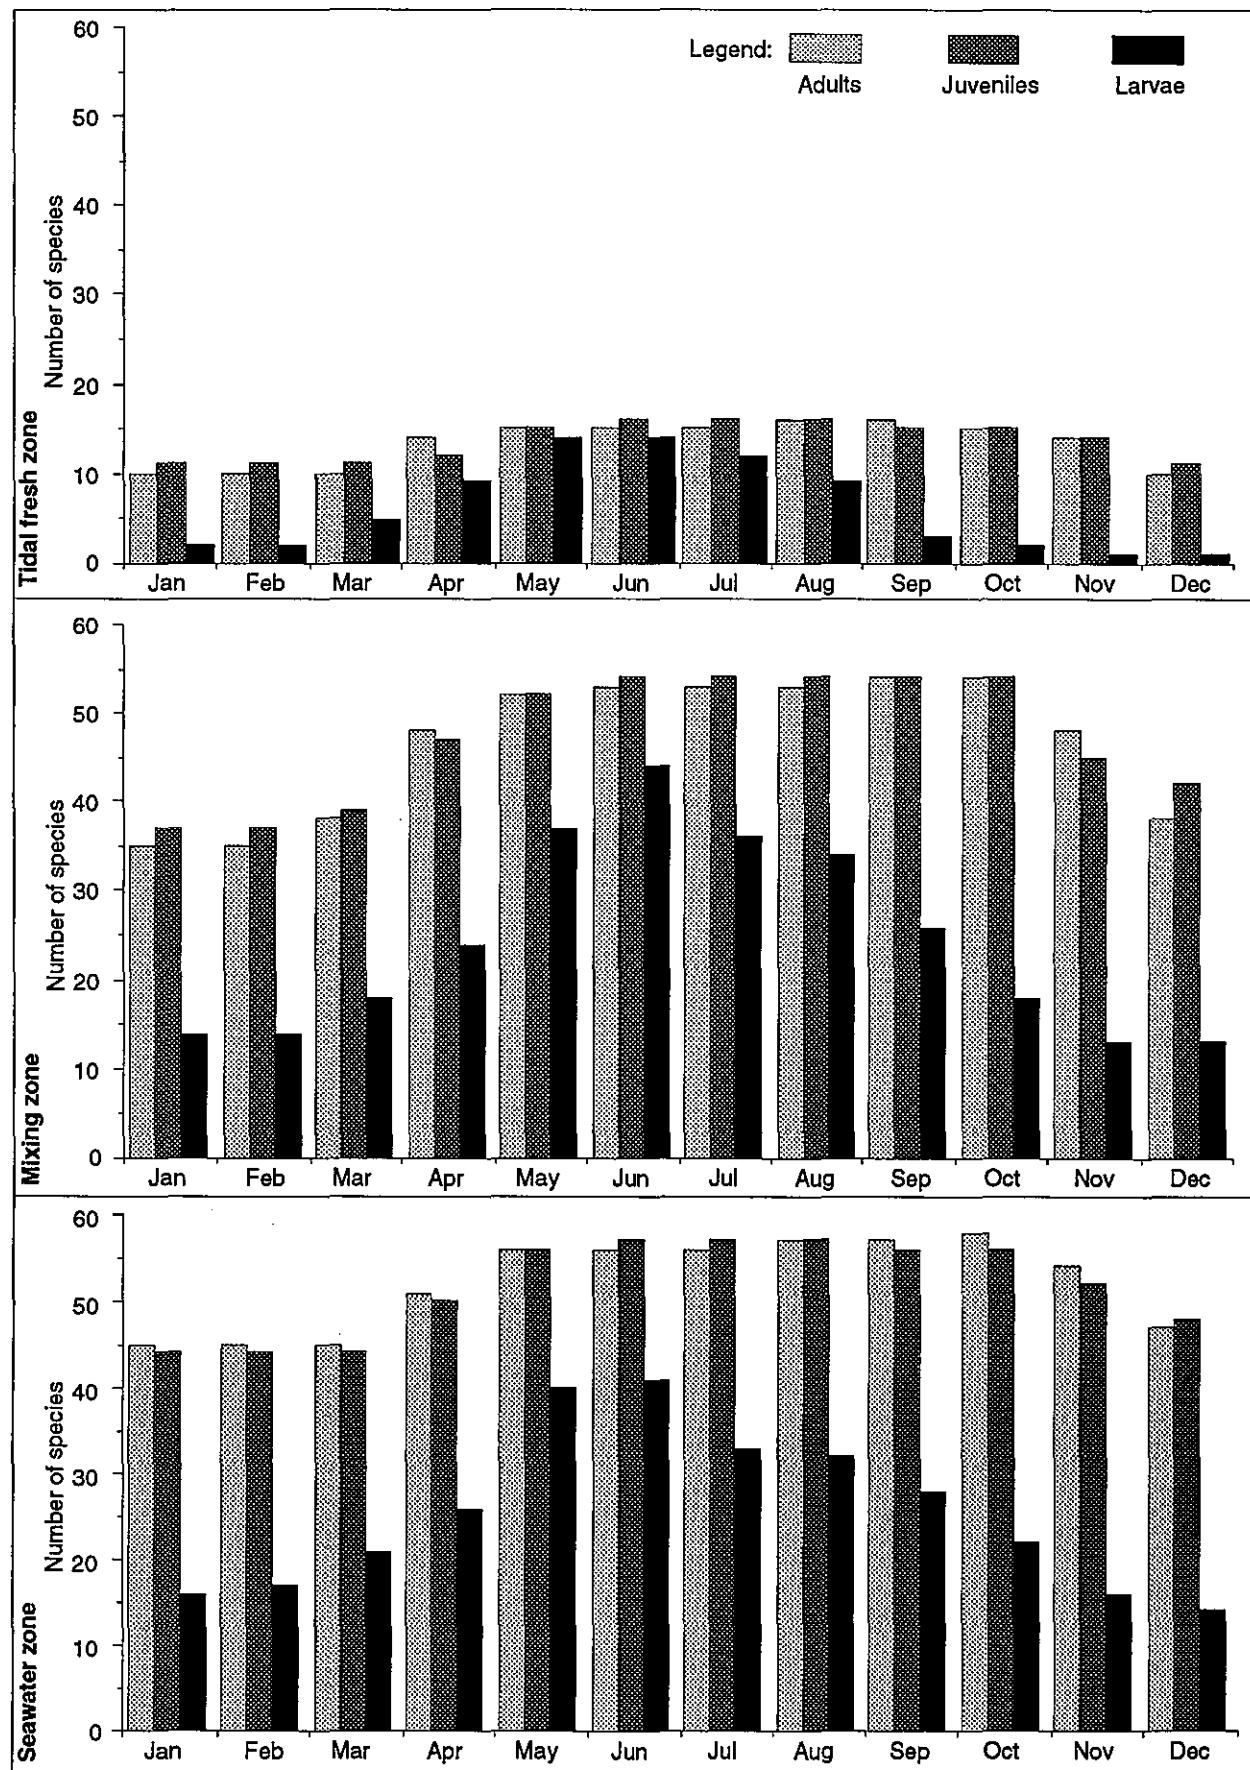

Figure 6. Number of ELMR species* in North Atlantic estuaries, by salinity zone, life stage, and month.

* number of species with relative abundance of 'common' or greater, averaged across estuaries.

interacting factors that affect salinity such as freshwater inflow, wind, and tides. To compile information on species distribution according to these zones, it is assumed that if a particular salinity zone expands or contracts, the distribution of a mobile species in that zone will correspond to the shift. For example, if increased freshwater inflow enlarges the tidal fresh zone, the distribution of a species confined to that zone increases to include the new area. If a species tolerates a wide range of salinity, a shift may or may not occur. The assignment of a species in a salinity zone was ultimately determined by where they have been regularly observed or captured.

Species temporal distributions are often dependent on annual climatic conditions and water currents. Monthly distribution patterns were derived based on the consistent presence of a life stage within a particular month. If a species was only present during unusual events (e.g., drought), it was not included in the description of that species' distribution. However, if a species regularly occurs, even during a restricted time period, it was considered to be present for the specific month(s). Greater temporal resolution, such as on a biweekly rather than on a monthly basis, was not feasible.

Data reliability analysis. Mean data reliability by estuary was highest for the Sheepscot River and lowest for Narraguagus Bay (Figure 7). The reliability estimates seem to reflect the amount of fisheries research that has been conducted within an estuary. These data reveal that some estuaries have been the focus of numerous studies (e.g., Passamaquoddy Bay, Sheepscot River, Great Bay, Cape Cod Bay), particularly those that have academic/state research facilities or industries requiring environmental monitoring (e.g., nuclear power plants). These estimates also suggest that many smaller bays and estuaries have not been extensively researched (e.g., Englishman/Machias bays, Narraguagus Bay, Saco River, Wells Harbor, Merrimack River).

- When averaged across estuaries and analyzed by salinity zone, data reliability was lower in the tidal fresh than in the mixing and seawater zones. This may be because the selected species are primarily estuarine, not freshwater. In addition, relatively few systematic faunal surveys have been conducted in tidal freshwaters.
- Data for juveniles and adults were most reliable, while data for spawning adults, larvae, and eggs (particularly demersal eggs) were less certain. This reflects that most biological surveys have focused on adult and juvenile life stages. Species-specific studies of spawning adults, larvae, and eggs have not been conducted in most estuaries. Thus, some of the information for

these life stages was inferred from general life history studies and data from similar estuaries.

- When averaged across salinity zones and life stages, and analyzed by species (Figure 8), data reliability was relatively high for most of the highly exploited commercial and recreational species (e.g., bivalves, Atlantic salmon, striped bass), and for endangered species (shortnose sturgeon). This reflects the comparatively greater number of studies conducted to monitor and manage species that are economically important. Data reliability was relatively low for several species that: 1) were at the edge of their environmental ranges (e.g., daggerblade grass shrimp, tautog); 2) were of little commercial importance (e.g., sticklebacks, smooth flounder); 3) had relatively unclear present distributions compared to past estimates (e.g., haddock, Atlantic sturgeon); and/or 4) had certain life stages that were unavailable to conventional gear types (e.g., rock gunnel, American sand lance).

Figure 7. Mean data reliability by estuary.

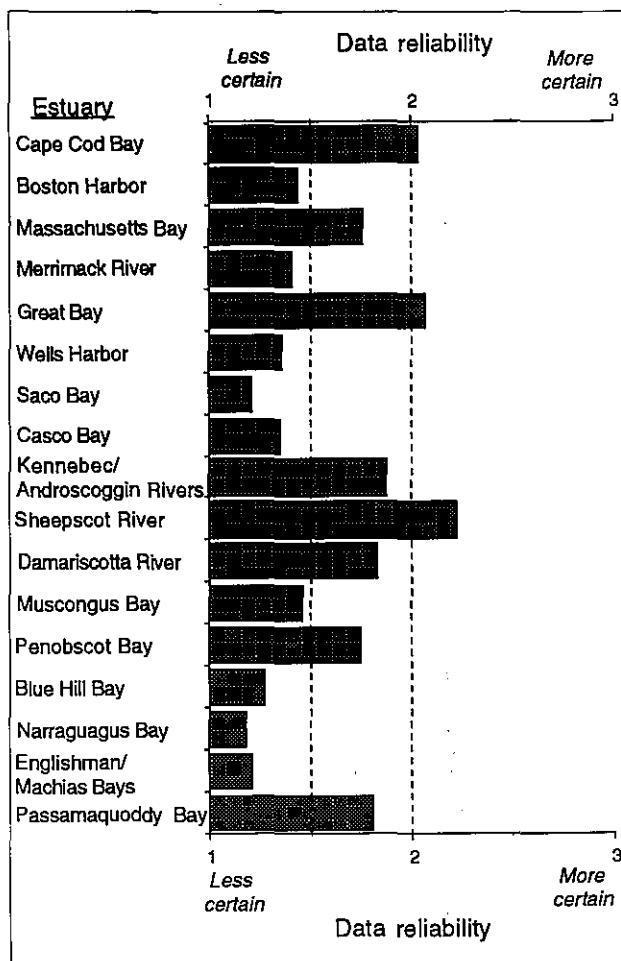

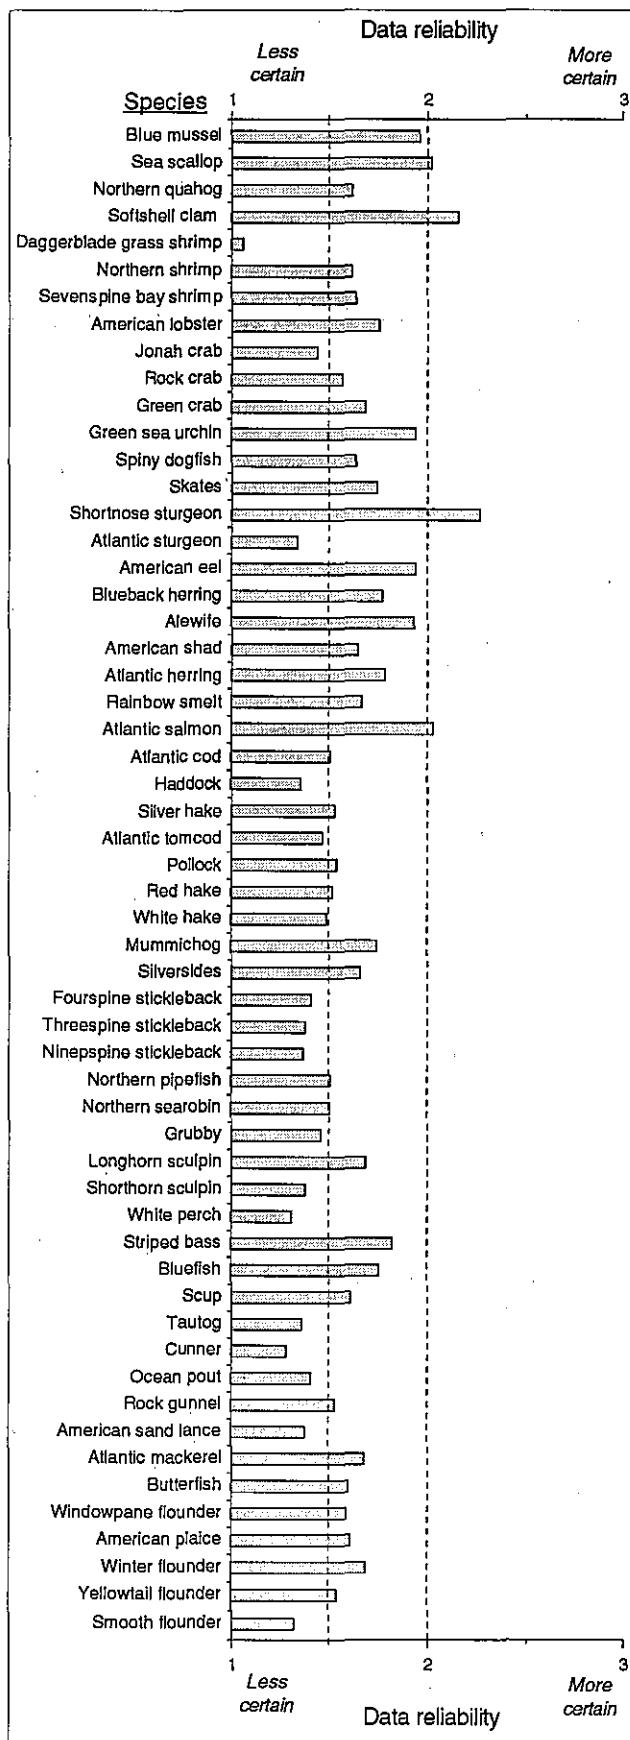

Figure 8. Mean data reliability by species.

Coupling of Estuarine and Marine Ecosystems

Classifying and comparing estuaries. Although the qualitative nature of the data presented precludes statistical analysis of species abundances among estuaries, comparisons can be made using data on the presence/absence of species in salinity zones. This information, combined with the spatial and temporal distribution data, is the strength of the ELMR data base. Estuaries can be loosely categorized by their physical and chemical characteristics and their associated species assemblages (Monaco and Lowery in prep). The relative importance of individual estuaries to specific species may also be determined.

The species found in an estuary are sensitive indicators of both the mean and extreme environmental conditions within that estuary. Estuaries can be classified by the number of species present and by whether the fauna are primarily marine, estuarine, or freshwater (Tyler 1971, MacDonald et al. 1984, Ayvazian et al. 1992). Species assemblages may correlate with physical characteristics, such as bottom substrate, vegetation, and spatial/temporal characteristics of salinity zones. Thus, information on species presence/absence or other attributes may be used to determine the similarities and differences among estuaries. Alternately, a comparison of estuaries and associated species can help elucidate ecological variables that might account for shifts in species distribution and community structure. For example, a species may show differing salinity tolerances among estuaries, suggesting that some other factor such as temperature, competition, or predation may be regulating its distribution.

Linkages to marine ecosystems. Many species inhabit estuaries year-round; however, a large number of species only use estuaries for specific parts of their life histories. Most of these latter species fall into four general categories: 1) diadromous species, which use estuaries as migration corridors and, in some instances, nursery areas; 2) species that use estuaries for spawning, often at specific salinities; 3) species that spawn in marine waters near the mouths of estuaries and depend on tidal- and wind-driven currents to carry eggs, larvae, or early juveniles into estuarine nursery areas; and 4) species that enter estuaries during certain times of year to feed on abundant prey and/or utilize preferred habitats. The biological importance of an estuary can be assessed both by the number of species present and the density, and/or abundance, of specific life stages in the system relative to offshore habitats. Since many offshore species use estuaries as nursery areas or feeding grounds, these data may assist in identifying adverse effects of estuarine degradation on offshore populations.

East Coast of North America Strategic Assessment Project. Development of a diagnostic capability to link estuaries to marine ecosystems is a component of the *East Coast of North America Strategic Assessment Project* (ECNASAP) (NOAA 1991). The ECNASAP is currently under development through two joint pilot projects between NOAA and Canada (ACZISCC 1993). This project is defining the major biological, physical, chemical, and economic characteristics of the East Coast of North America to address multiple resource-use conflicts. The study area begins at the head of tide in estuaries and encompasses the continental shelf as defined by the 200-m isobath and epipelagic waters. The ELMR distribution and abundance data are the primary source of fish and invertebrate information for U.S. East Coast estuaries. These data will be integrated with the coastal and offshore living resource information to develop a consistent GIS data base on species found from the head of tide to past the continental shelf. This will enable the development of a capability to define the coupling of estuarine and marine ecosystems based on species' spatial and temporal distributions, life history strategies, and physical and hydrological habitat requirements (Monaco and Lowery in prep)

The ECNASAP complements other Federal marine environmental programs, e.g., National Status and Trends (O'Connor 1990), and will support regional environmental assessments of anthropogenic effects on living marine resources. Integration of biological and physical data will significantly improve our ability to identify and define the biological linkages and physical interchanges between estuarine and shelf habitats. As it becomes apparent that the cumulative effects of small alterations in estuaries have a systemic impact on coastal ocean resources, it is more important than ever to compile consistent information on the nation's estuarine fishes and invertebrates. Although the knowledge available to effectively conserve and manage living resources is limited, the ELMR program provides an important tool for assessing the status of estuarine fauna and examining their relationships with other species and their environment. The ELMR data base provides the best available baseline information on the zoogeography and ecology of estuarine fishes and invertebrates, and identifies gaps in our knowledge of these resources.

Acknowledgements

We thank those individuals that reviewed the data in this report and provided additional information. Without their efforts, a study of this magnitude and complexity would not be possible. In addition, we thank the many other scientists and managers who provided contacts and references. Special thanks are due to Tony Lowery and Pamela Rubin for their comments on this manuscript. The cover illustrations of lobster, cod, and herring are from Goode (1884).

Appendix 2. Estuary notes

Compared to the Atlantic coast south of Cape Cod, estuaries in the North Atlantic region have colder and deeper waters, little seasonal variation in temperature, significant freshwater inflow from only a few large rivers (Figure 9), stronger tides, and a predominantly cold-temperate fauna (Gosner 1971, TRIGOM-PARC 1974, Berrill and Berrill 1981, NOAA 1990, Anonymous 1991, Ayvazian et al. 1992). The Gulf of Maine consists of a deep central basin enclosed by Georges Bank, with water circulating counterclockwise through the gulf; entering through the Northeast Channel and Browns Bank and exiting via Great South Channel and Nantucket Shoals. The northern coastline is mostly rocky, consisting primarily of granite, schist, and gneiss. In many regions the consolidated rocks are overlaid by glacial till, or sand/gravel deposits. The estuaries of this area are dominated by submerged, glacier-scoured river valleys with unmodified mouths, but there are some exceptions (e.g., Boston Harbor, Wells Harbor). Tides are semidiurnal and peak freshwater inflow occurs during April and May due to the spring runoff. Average precipitation across the region is 40-46 inches/yr. Cape Cod is generally considered to be the biogeographic boundary between the Virginian province to the south and the Scotian province to the north (Briggs 1974). However, it is considered to act as a "selective filter" rather than an absolute barrier (Gosner 1971) because many of the cold-temperate, boreal fauna that dominate the North Atlantic have ranges extending south of the cape and several eurythermal migrants from the south enter the Gulf of Maine seasonally.

For a general description of the physical and hydrological characteristics of individual estuaries the reader is referred to NOAA 1985, NOAA 1990, Anonymous 1991, and Larsen and Dogget 1976. Average daily flow is one of the primary determinants of the salinity distribution and stratification in each system, while surface area and depth (approximated at mean tide level) describe the relative size of the estuaries (NOAA 1990, NOAA 1993). The Penobscot, Kennebec/Androscoggin, Merrimack and St. Croix (Passamaquoddy Bay) Rivers have the highest average daily freshwater inflow and contribute more fresh water to the Gulf of Maine than the remaining thirteen watersheds combined (Figure 9). Massachusetts and Cape Cod bays have the highest average depth and surface area, however, several of the eastern Maine systems (e.g., Penobscot, Blue Hill, and Passamaquoddy bays) are also comparatively large. The comparatively smaller systems (e.g., Wells Harbor, Great Bay, and Merrimack River) occur in the mid-western portion of the Gulf of Maine (Figure 9). To assist in the interpretation of ELMR data, unique features of certain estuaries and the rationale for their

inclusion to our database are presented below. Modifications to specific National Estuarine Inventory (NEI) maps (NOAA 1985) are also listed; however, a more complete revision of the NEI is in progress.

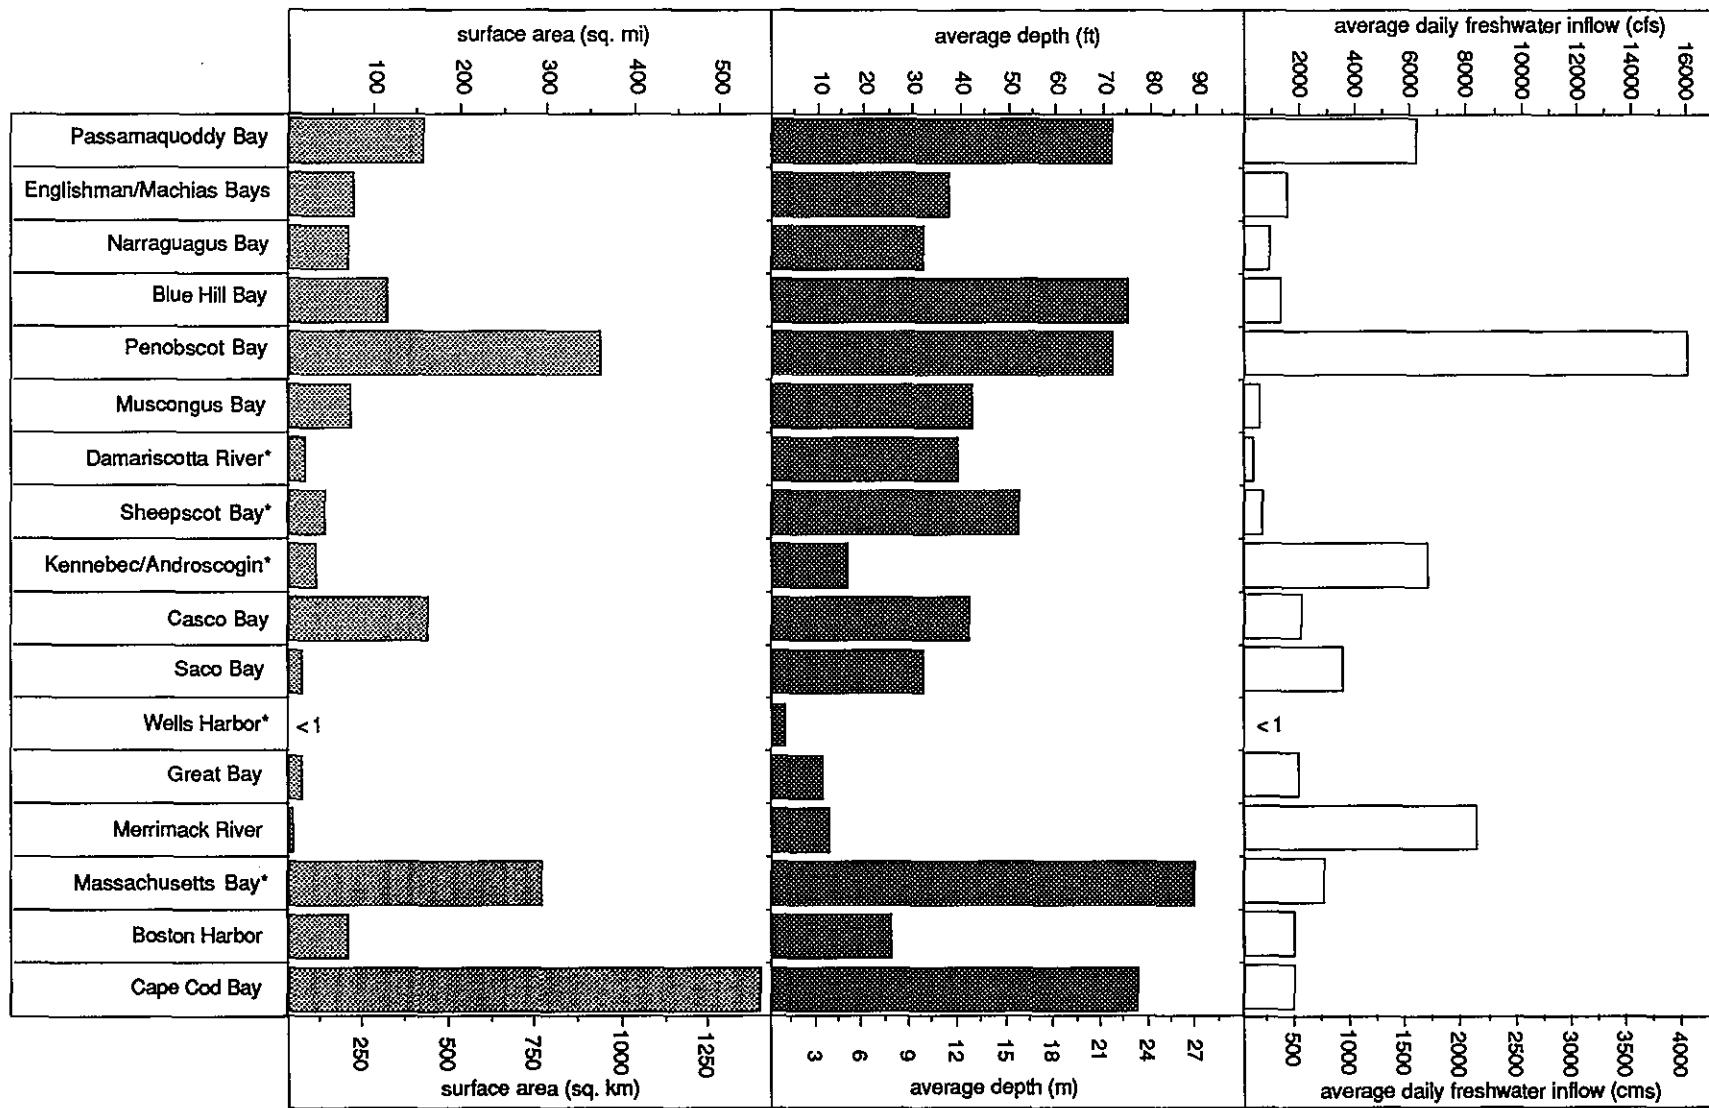

- **Passamaquoddy Bay:** Extremely strong tidal currents make the salinity zone boundaries highly variable within the system. Intrusion of lower Bay of Fundy water often makes Passamaquoddy Bay warmer than neighboring systems just to the west, and causes certain biological processes (e.g., herring spawning) to occur earlier than in those estuaries (Thomas 1983). Refer to NEI map 1.01 (Passamaquoddy Bay) and NOAA charts # 13328 or 13398 for more information.

- **Penobscot Bay:** According to regional hydrological work, the seawater zone boundary should be relocated in NEI map 1.05 (Penobscot Bay) to the area between Fort Point and West Penobscot (Normandeau 1975). Refer to NOAA chart #13309 for help in locating these landmarks.

- **Damariscotta River:** This system was differentiated from the large estuary depicted in NEI map 1.07 (Sheepscot Bay) due to its distinct hydrology. A small tidal fresh zone is usually present just below the head of tide dam at Damariscotta Mills. Manual closure of the dam's sluiceway during exceptionally dry seasons, however, may result in the disappearance of the freshwater lens. McAlice (1977) provides the only detailed hydrological information for the estuary. The system's seaward boundary is a straight line from Pemaquid Point to Ocean Point. Refer to NOAA chart #13293 for help in locating the landmarks mentioned.

- **Sheepscot River:** This system was differentiated from the estuary depicted in original NEI map 1.07 (Sheepscot Bay) due to its distinct hydrology. It is separated from the Kennebec/Androscoggin estuary by Upper Hell Gate on the Sasanoa River and by the marshland at the southern end of Hockomock Bay. Also, in the original NEI, the seawater zone is erroneously drawn through the entire Back River/Montsweag Bay branch. Hydrographic data from Maine Yankee Nuclear Power Company (1978) and Stickney (1959) indicate that brackish water fills most of this system, from Bailey Point southward through Knubble Bay. Paradoxically, the seawater zone extends up through the lower Sheepscot River mainstem, as indicated in the NEI. The Back River/Montsweag Bay complex exhibits lower salinities because it is diluted from Kennebec water entering through the Sasanoa River. Head of tide is at the dam in Head Tide village and the system's seaward boundary is a line from Ocean Point to Cape Newagen to Indian Point. Refer to NOAA chart #13293 for help in identifying the landmarks mentioned.

*Figure 9. Average flow, depth, and surface area of North Atlantic estuaries. (NOAA 1990, NOAA 1993)
additions to NEI (NOAA 1985)

• **Kennebec/Androscoggin Rivers:** This system was differentiated from the large estuary depicted in original NEI map 1.07 (Sheepscot Bay) due to its distinct hydrology. It is separated from the Sheepscot estuary by Upper Hell Gate on the Sasanoa River and by the marshland at the southern end of Hockomock Bay. In addition, the seawater and mixing zones of the Kennebec/Androscoggin Rivers are incorrectly depicted in the NEI as extending through Merrymeeting Bay. Squiers (1990) indicates that the huge volume of fresh water emanating from these systems creates a tidal freshwater lens extending through the bay to just above Chops Point. Furthermore, Larsen and Doggett (1976) report that the bottom salinity just 7 miles from the river mouth was 24 ppt in August (low flow season). This suggests that the mixing zone extends through most of the lower Kennebec, from Merrymeeting Bay to Squirrel Point. Head of tide is at the dam in Augusta, and the system's seaward boundary is a straight line from Indian Point to Small Point. Refer to NOAA chart #13293 for help in identifying the landmarks mentioned.

• **Wells Harbor:** Although this estuary is relatively smaller than the other North Atlantic estuaries considered, it was added to the NEI due to its importance as a National Estuarine Research Reserve. We consider the Wells Harbor system to consist of the Webhannet and Little River watersheds (Ayvazian et al. 1992, Ward 1993). These are both shallow, bar-built systems connected by a small marsh behind Laudhaum Beach. Both seawater (> 25 ppt) and mixing zones (0.5-25 ppt) were considered to be present for the ELMR analysis, however, a tidal fresh zone was not included due to its relatively small surface area. Refer to NOAA chart #13286 for more information.

• **Merrimack River:** This estuary is not considered to have a seawater zone according to NEI map 1.11 (Merrimack River) due to the extreme fluctuations in salinity at its shallow mouth. Species diversity is highest closest to the marine waters just outside of the mixing zone, which can range from 25 to 5 ppt over a tidal cycle. The primary habitats in the mixing zone are tidal flats and the daily freshwater inflow is relatively high. Changes from the original NEI map are that the mixing zone is considered to extend from the mouth of the river to Pow Pow River, and that the head of tide is now considered to be approximately 3000 m north of Haverill. Refer to NOAA chart #13282 or 13274 for help in identifying these landmarks.

• **Massachusetts Bay, Boston Harbor and Cape Cod Bay:** NEI map 1.12 (Boston Bay) shows the delineation for Boston Harbor and NEI map 1.13 shows Cape Cod Bay. Due to its regional importance and distinct hydrography, Massachusetts Bay was added

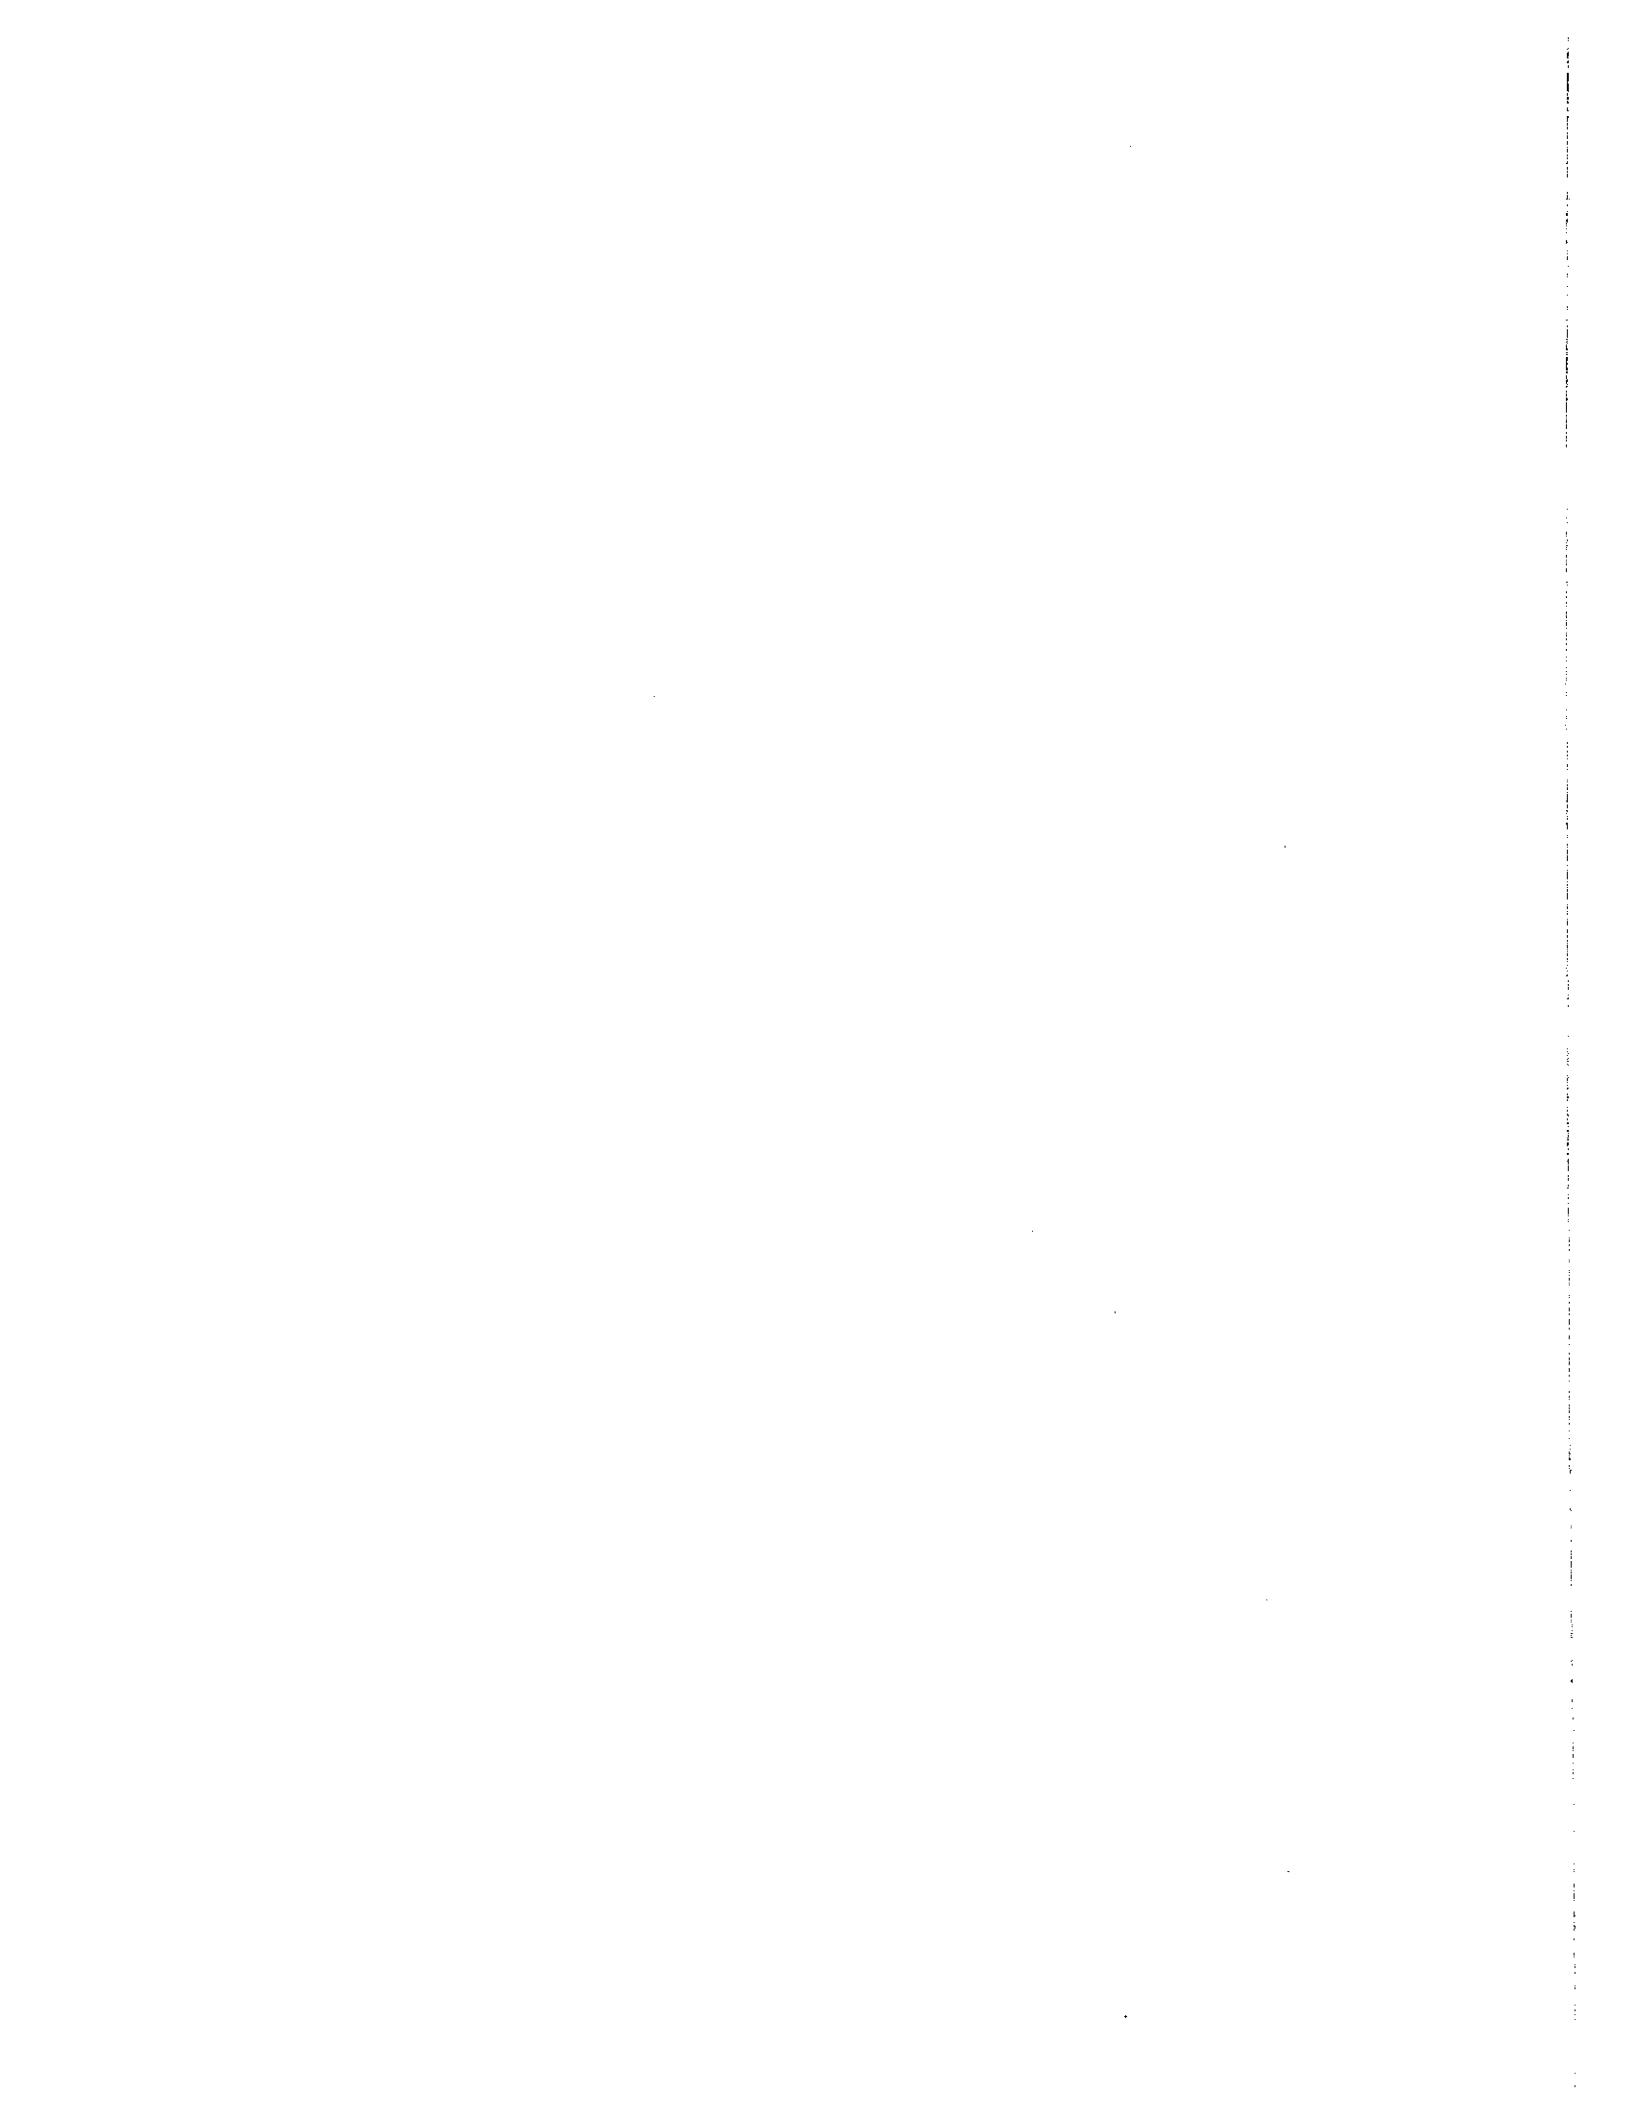

to the ELMR database with Boston Harbor considered as a sub-estuary of this system. Massachusetts Bay and Cape Cod Bay are considered to be large seawater embayments functioning as estuaries. We realize that there are undoubtedly small mixing and tidal fresh zones in the areas not included in the NEI delineations, but these are not considered due to their relatively small surface areas. The larger Massachusetts Bay "ecosystem" is sometimes considered to include Massachusetts Bay proper, Boston Harbor and Cape Cod Bay with some of the freshwater inflow coming from the Merrimack River (Townsend et al. 1991). These three areas are separated to present the fisheries information on a somewhat finer scale. For ELMR purposes, Massachusetts Bay is considered to be the area from the mouth of Boston Harbor to a line drawn from Eastern Point of Gloucester Harbor to Brant Rock to the south. Refer to NOAA chart #13267 for help in identifying these landmarks.

Appendix 3. Species life history notes

The five “typical” life stages considered by the ELMR program were adults (A), spawning adults (S), juveniles (J), larvae (L), and eggs (E). Adults were defined as reproductively mature individuals, Juveniles as immature but otherwise similar to adults, Spawning adults as those releasing eggs and sperm, Larvae as the early developmental stage(s) from hatching to a form resembling the adult, and Eggs as the early developmental stage from spawning to hatching. The complex life histories of some species, and the subsequent difficulty in placing them into a comprehensive classification scheme, necessitate the following supplementary information when there was deviation from the typical categorization (e.g., ovoviparous reproduction in spiny dogfish).

Invertebrates. Sessile invertebrates, such as bivalves, usually have a patchy rather than a uniform distribution. Specific areas may contain acceptable salinity regimes, but suitable bottom habitat for colonization may not exist. Therefore, the total areal distribution of these organisms may have been overestimated; nonetheless, inhabited zones are identified. Specific habitat requirements and life history characteristics of a number of invertebrate species are provided below.

• **Blue mussel:** *Mytilus edulis* is common on hard substrates in intertidal and subtidal beds throughout the Gulf of Maine. The reproductive cycle may vary significantly between years, and larvae may settle out at low levels throughout the year in certain areas. High winter mortality occurs in some years and locations (Newell 1989).

• **Sea scallop:** *Placopecten magellanicus* is not regularly found in < 20 ppt and beds in estuarine areas tend to be patchy, especially compared to those further offshore (Mullen and Moring 1986, Shumway 1991). Eggs are buoyant and larvae remain pelagic for 4-6 weeks before settling to the bottom. Spawning is intermittent and a percentage may mature in one year in some areas.

• **American oyster:** *Crassostrea virginica* is also known as the Eastern oyster. It is present only in relatively warm subtidal or intertidal areas of a few estuaries in the study area. Northern Atlantic oysters may be a distinct physiological race with spawning temperature requirements (Sellers and Stanley 1984) different from those of Mid-Atlantic oysters. (*Ostrea edulis*, the European oyster, was not assessed in this study but it has been introduced to some areas of the Maine coast through mariculture projects.)

• **Northern quahog:** *Mercenaria mercenaria* is also known as the hard clam. Populations north of Massachusetts are small and patchy in relatively warm, high salinity (>20 ppt) areas. In the extreme northern populations, spawning success may be limited (Stanley and DeWitt 1984).

• **Softshell clam:** *Mya arenaria* usually spawns once a year in the northern Gulf of Maine, whereas southern populations have exhibited bimodal spawning. Settlement of seed clams tends to be very patchy and dependent upon hydrographic conditions and/or predation (Newell and Hidu 1986). Mortality of eggs, larvae, and seed clams is extremely high. Larvae are less tolerant of low salinities than adults. Its northern range is limited by water temperature that must be >12-15°C for successful spawning. In some areas (e.g., Machias Bay) artificial seeding programs may temporarily increase the abundance of juveniles.

• **Daggerblade grass shrimp:** *Palaemonetes pugio* is also known as the grass shrimp. It is most abundant locally in vegetated habitats of warm bays. Soon after mating, females fertilize and extrude eggs onto their pleopods where they are held for up to two months until hatching as larvae (Williams 1984). This species may be confused or grouped with *P. vulgaris*, which is more boreal and prefers higher salinities than *P. pugio*. *P. pugio* is much more common south of Cape Cod. Juveniles mature early in their first year. For the purposes of the ELMR program, the spawning stage (S) is defined as the period of mating/fertilization/egg extrusion; the larval stage (L) consists of the protozoal and zoeal stages; and the egg stage (E) refers to ovigerous females.

• **Northern shrimp:** *Pandalus borealis* is the most common species of its genus in the Gulf of Maine, but the closely related *P. propinquus* and *P. montagui* are also found in some areas. This species is hermaphroditic, maturing first as males to spawn in the summer at approximately 2.5 years, then passing through a series of transitional stages to spawn the next summer as females at 3.5 yr. Soon after mating in the summer/early fall, females fertilize and extrude eggs onto their pleopods, where they are held for several months until hatching as larvae the following spring (Haynes and Wigley 1969, Shumway et al. 1985). The bulk of the inshore fishery consists of berried females that have moved inshore in the fall and winter to release their larvae. The distribution of juveniles is largely unknown. For the purposes of the ELMR program, the spawning stage (S) is defined as the period of mating/fertilization/egg extrusion; the larval stage (L) consists of the protozoal and zoeal stages; and the egg stage (E) is synonymous with ovigerous females.

• **Sevenspine bay shrimp:** *Crangon septemspinosa* is also known as the sand shrimp. It is the most common shallow water shrimp in the Gulf of Maine and is found primarily in eelgrass beds and sandy bottoms. This species exhibits seasonal movements from shallow to deeper water and is relatively inactive in the winter months. Soon after mating females fertilize and extrude eggs onto their pleopods, where they are held for approximately one month until hatching as larvae (Haefner 1979). There is some evidence showing two separate spawning periods in the northern part of its range (Corey 1987). For the purposes of the ELMR program, the spawning stage (S) is defined as the period of mating/fertilization/egg extrusion; the larval stage (L) consists of the protozoal and zoal stages; and the egg stage (E) is synonymous with ovigerous females.

• **American lobster:** *Homarus americanus* is found primarily in salinities >20 ppt (Cooper and Uzmann 1980, MacKenzie and Moring 1985). Eggs and larvae are less tolerant of low salinity than juveniles and adults. Mating typically occurs every other year for individual females, when the male places a spermatophore into a freshly molted female (but intermolt matings have been reported). Eggs are normally extruded 11-13 months later (MacKenzie and Moring 1985) and multiple fertilizations are possible from a single spermatophore. Eggs are carried 9-11 months and hatch in spring to early fall depending upon temperature. Berried females are present throughout the year but numbers may be lower in the summer as eggs are hatched and molting/mating is occurring. Pelagic larvae molt four times, then settle to bottom as early benthic phase lobsters with adult characteristics. For the purposes of the ELMR program, the spawning stage (S) is defined as the period of fertilization/egg extrusion; the larval stage (L) consists of the mysis and postlarval stages; and the egg stage (E) is synonymous with ovigerous (berried) females.

• **Jonah and Atlantic rock crabs:** *Cancer borealis* and *C. irroratus* are found primarily in salinities >20 ppt and are sometimes grouped together (Krouse 1980, Williams 1984). *Cancer irroratus* prefers sandy substrates and is usually in shallower water, whereas *Cancer borealis* prefers rockier substrates, is usually in deeper water, and is less tolerant of low salinities. Juvenile *C. borealis* are seldom recorded from inshore areas and are easily confused with juvenile *C. irroratus* (Williams and Wahle 1992). For the purposes of the ELMR program, the spawning stage (S) is defined as mating/fertilization/egg extrusion; the larval stage (L) consists of the zoeal and megalopal stages; and the egg stage (E) is synonymous with ovigerous (sponge) females.

• **Green crab:** *Carcinus maenas* is the most common shore crab found intertidally and subtidally in the Gulf of Maine down to at least 6 ppt. Abundance in mid-coast and northern Maine may be affected by interannual variations in temperature as this species nears the edge of its range. Mating typically occurs in the summer and/or fall and hatching of eggs occurs in the spring and/or summer (Berrill 1982, Williams 1984). For the purposes of the ELMR program, the spawning stage (S) is replaced by mating (M), which designates copulation only; the larval stage (L) consists of the zoeal and megalopal stages; and the egg stage (E) is synonymous with ovigerous (sponge) females.

• **Green sea urchin:** *Strongylocentrotus droebachiensis* is usually not found in salinities < 29 ppt, however, it does occur intertidally as well as subtidally in the Gulf of Maine. Spawning seems to coincide with the spring phytoplankton bloom (Starr et al. 1990), but there is some anecdotal evidence suggesting more than one spawning event. Sperm and eggs are shed into the water where fertilization takes place. Within approximately 12 hours of fertilization, the blastula becomes ciliated and free swimming. Gastrulation ensues and a planktonic "echinopluteus" larva develops and persists for up to 3-4 months. Late in the larval stage, usually early summer, the test begins to form and the echinopluteus sinks to the bottom as a settling juvenile that is < 1 mm in diameter. This settlement usually occurs over a 4-6 week period showing a peak of young-of-year juveniles (L. Harris, pers. comm.). Growth rates are highly variable and it takes approximately 1.5-3.5 years for individuals to reach maturity at >20 mm diameter. There may be some local migration to deeper water to overwinter but this species is primarily a slow moving, shallow water species in the Gulf of Maine (Himmelman et al. 1983). Harvesting of ripe animals for high quality roe has developed fairly recently and it is unclear how this fishery is impacting local populations (Chenoweth 1992).

Fishes. The use of salinity zones generally describes the spatial distribution of estuarine fishes. However, for some species a combination of habitat characteristics, such as bottom type, water temperature, bathymetry, etc., would more accurately indicate these distributions. Specific habitat requirements and life history characteristics of a number of fishes are presented below.

• **Spiny dogfish:** *Squalus acanthias* is a summer migrant to the Gulf of Maine, moving offshore in the winter and inshore in the summer. Catch statistics show high inter- and intra-annual variability due to their tendency to school by size and sex. Males and mature females are most common inshore. Spiny dogfish are long lived and ovoviparous. Fecundity is low (2-15

pups after 18-22 month gestation) and the juvenile stage may last >10 years. Individual females produce young only in alternate years. In the Gulf of Maine, mating is assumed to occur in the colder months (Feb.-Mar.) offshore (Bigelow and Schroeder 1953, Nammack et al. 1985). It has also been suggested that females migrate into shallow water from November to January to bear their young (Jensen 1966, Nammack et al. 1985). Nonetheless, there are few recorded observations of parturition and/or mating, and the actual occurrence of these events in particular estuaries and embayments is somewhat questionable (Jensen 1966). We have reflected this uncertainty by assessing the mating and parturition stages as *no information available* in some systems. For the purposes of the ELMR program, the spawning stage refers to mating (M) and internal fertilization of eggs; and while no egg or larval stages are recognized, the egg stage (E) is replaced by parturition (P) data.

- **Skates:** The most common species of *Raja* in the inshore areas of the North Atlantic are little skate (*R. erinacea*), winter skate (*R. ocellata*), and barndoor skate (*R. laevis*). Thorny skate (*R. radiata*) and smooth-tailed skate (*R. senta*) are less commonly found (Bigelow and Schroeder 1953, Scott and Scott 1988). Skates are oviparous, and generally extrude egg cases shortly after fertilization. Spawning season differs between species. Most species tend to migrate in response to seasonal changes in temperature. For the purposes of the ELMR program, the spawning stage refers to mating (M) and internal fertilization of eggs and the egg stage (E) refers to the period from egg extrusion to hatching. Upon hatching, young skates are considered juveniles so there is no larval stage.

- **Shortnose and Atlantic sturgeons:** Shortnose sturgeon (*Acipenser brevirostrum*) is considered to be endangered throughout its range (USFWS 1993) and is protected in Massachusetts and New Hampshire (Johnson 1987). Atlantic sturgeon (*Acipenser oxyrinchus*) is protected in Massachusetts (R. Iwanowicz pers. comm.) and is a species of special concern in New Hampshire and Maine (Johnson 1987). Both species are anadromous, occur primarily in large river systems, are slow growing, and long-lived. Spawning may occur in fresh or brackish water and presumably does not occur every year for individual females. Atlantic sturgeon eggs are demersal and adhesive, larvae drift downstream, and juveniles remain in fresh/brackish water for their first summer, then migrate seaward (Dadswell et al. 1984, Kieffer 1991). Little is known about juvenile stages, which are not caught by the large mesh gillnets used in most surveys. It is unknown if there is migration of adult shortnose sturgeon out of fresh/brackish water areas as is true for the Atlantic sturgeon. In some areas strays have been

encountered (e.g., shortnose sturgeon in Cape Cod Bay), but are not considered to be regularly present.

- **American eel:** *Anguilla rostrata* is catadromous with spawning occurring in the Sargasso Sea in the spring (Facey and VanDenAvyle 1987). The early pelagic larvae, called "leptocephali," may spend over a year in marine waters before being transported shoreward. As the leptocephali reach the continental shelf, they begin their metamorphosis into transparent "glass eels." As glass eels migrate into estuaries and fresh water, they develop pigment and are considered elvers, which then grow into the "yellow eel" stage. Yellow eels inhabit estuarine and fresh waters for years before maturing into the "silver eel" stage and migrating seaward. For the purposes of the ELMR program, emigrating silver eels are considered to be adults (A); yellow eels and elvers are considered to be juveniles (J); and glass eels are considered to be larvae (L) (leptocephali are not regularly encountered in the coastal North Atlantic). We retain spawning (S) and egg (E) stages in our data presentation but stipulate that both occur only in offshore waters.

- **Blueback herring and alewife:** *Alosa aestivalis* and *A. pseudoharengus* are often grouped together as river herring. Spawning occurs in spring, with alewives breeding 3-4 weeks earlier than bluebacks in the same watershed. Spawning habitats also tend to differ, with alewives spawning in slow flowing sections of slightly brackish or freshwater, and bluebacks spawning in more lotic sites (Mullen et al. 1986, Loesch 1987). Alewives are usually more abundant than bluebacks in the northern Atlantic region. Adults typically return to sea after spawning, and may spawn repeatedly in their natal river. Habitat alteration resulting from dams and pollution have historically limited areas available for the spawning of anadromous species throughout New England, and thus many local stocks are reduced from previous levels. Stocking and habitat mitigation programs exist for several rivers to attempt the restoration of target species including river herring.

- **American shad:** *Alosa sapidissima* is an anadromous species with a strong natal homing tendency. Adults tend to spawn only once in the freshwater portions of rivers at the southern edge of its range. However, with increasing latitude, the mean age at first spawning increases, the number of eggs spawned decreases, and the number of spawnings per lifetime increase so that a large percentage are iteroparous in the Gulf of Maine. Young of the year spend their first summer in the river/estuary and then migrate to the ocean in the fall. Shad tend to school during their oceanic phase (Weiss-Glanz et al. 1986, Dadswell et al. 1987). Johnson (1987) listed shad as a species of special concern in Maine.

- **Atlantic menhaden:** *Brevoortia tyrannus* are also known as pogies, and are summer migrants to the North Atlantic region. Spawning generally occurs offshore and south of Cape Cod (Rogers and VanDen Avyle 1989), where larvae and juveniles move inshore and into estuaries. Juveniles are often highly abundant in estuarine waters south of Cape Cod. The spawning status north of Cape Cod is unclear, but it is assumed that primarily large adults move into the North Atlantic to feed. There is high intra- and interannual variability in the presence and abundance of this species, especially in northern areas.
- **Atlantic herring:** *Clupea harengus* migrate from feeding grounds along the Maine coast during fall, arriving in southern New England during winter (Kelly and Moring 1986). Larger individuals move further distances. Spawning begins earliest (late summer to early fall) in northern locations and progressively later westward and southward. Spawning occurs just outside the mouths of many North Atlantic estuaries/embayments (e.g., Massachusetts Bay, Saco Bay, Boothbay Harbor, Blue Hill Bay, Machias Bay) where demersal eggs are typically deposited on rocky or gravelly substrates. Larvae are dispersed to the estuaries/embayments upon hatching. Significant mortality occurs during this stage, presumably from predation and food limitation (Campbell and Graham 1991). Larvae become juveniles, called "brit herring," in the spring and form large schools inshore. During summer, the larger juveniles are harvested in a directed fishery as "sardines." Adults are also commercially harvested. The possibility of northern and southern breeding stocks within the Gulf of Maine is presently under investigation.
- **Atlantic salmon:** *Salmo salar* is anadromous. Spawning adults (S) occur in freshwater during the fall. Eggs (E) overwinter in a gravel nest, called a "redd," until they hatch in the spring as yolk-sac larvae (L), called "alevins." After yolk-sac absorption, the "fry" disperse from the redd. Juveniles (J), called "parr," remain in freshwater for 2-3 years and then mature into "smolts" which migrate to the sea. Some adults, called "grilse," spend one year feeding at sea before returning to their natal river to spawn. Other adults return after two or more winters at sea and are usually larger than grilse. Repeat spawners have also been recorded but are relatively uncommon in the North Atlantic (Danie et al. 1984, Friedland 1993). Salmon are stocked as fry, parr, and/or smolts in several rivers throughout the Gulf of Maine to attempt restoration of populations. The abundance of salmon in the North Atlantic region at present is extremely low. Although there have been documented returns of wild salmon—most notably in the Penobscot, Narraguagus, and Merrimack rivers (Anonymous 1993)—most of the populations mentioned in this report are assumed to be at least partially sustained by stocking.
- **Haddock:** *Melanogrammus aeglefinus* rarely enter salinities <30 ppt and generally avoid depths of < 9m. Juvenile haddock remain pelagic for several months before settling to the bottom. At present stocks are believed to be severely depleted compared to historic levels (NEFSC 1992).
- **Silver hake:** *Merluccius bilinearis* is also known as whiting. Migration is extensive, with overwintering in deeper waters of the Gulf of Maine and movement to shallow water in the spring to spawn. This report focuses upon the northern stock, although there is a southern stock south of Georges Bank which appears to have different seasonal migration patterns (NEFSC 1992).
- **Atlantic tomcod:** *Microgadus tomcod* is also known as frostfish. This semi-anadromous species spawns in fresh and brackish water, but the larvae can only develop in brackish water. Therefore, they drift seaward shortly after hatching so that larvae, and young of the year, are found primarily in the mixing zone (Stewart and Auster 1987).
- **Red and white hakes:** The early life stages of *Urophycis chuss* and *U. tenuis* are often not distinguished from each other in ichthyoplankton surveys. In the Gulf of Maine, adult *U. chuss* are more abundant than juveniles, whereas the reverse is true for *U. tenuis*. North of Cape Cod, *U. tenuis* appears to be the more abundant species. Depth distribution of both species varies by age and season, with younger juveniles tending to be in shallower areas (Musick 1974, Markle et al. 1982). Red hake juveniles often live within or around sea scallops (*Placopecten magellanicus*). In the North Atlantic, spawning of white hake has been variously described in the winter and spring, aperiodically throughout the year, and/or in the summer (Bigelow and Schroeder 1953, Markle et al. 1982). Clearly, the reproductive period is not well defined for estuaries in the Gulf of Maine and this is reflected in our assessment.
- **Mummichog:** The entire life cycle of *Fundulus heteroclitus* is completed within the estuary, and all life stages are euryhaline. One of the most abundant fishes in East Coast estuarine marsh habitats, *F. heteroclitus* often co-occurs in the North Atlantic with the less abundant *F. majalis*, particularly south of Massachusetts Bay. *F. heteroclitus* is relatively inactive and may move to deeper water in the winter months, but it is expected to be resident year-round in estuaries. Mummichogs may spawn more than 8 times in a season. The eggs incubate in air and are not sub-

merged until the next spring tide after they are laid (Abraham 1985).

- **Silversides:** *Menidia menidia* is the dominant species in the North Atlantic region but *M. beryllina* co-occurs in some systems. This species exhibits at least some seasonal migration to warmer waters in winter months. Spawning occurs primarily in the intertidal zone during high tide and seems to be dependent upon lunar phase and daylight (Fay et al. 1983a). Most silversides mature by age one and die after their first spawning, although a small percentage may live a second year. Early life history stages are not as euryhaline as the adults and juveniles.

- **Sticklebacks:** The threespine (*Gasterosteus aculeatus*), fourspine (*Apeltes quadracus*), and ninespine (*Pungitius pungitius*) are the most common stickleback species in the region and are sympatric. *Gasterosteus wheatlandii* may also be present in some areas and grouped with these sticklebacks. All of these species have highly plastic life histories, with anadromous and non-migratory populations often existing in the same estuarine systems. These species build nests and have highly ritualized breeding behaviors. Temperature and salinity can cause morphological variations. *A. quadracus* can be found in fresh water (Wooten 1976, Hardy 1978), but not as commonly as *G. aculeatus* or *P. pungitius*. Spawning usually occurs in brackish or fresh water for these species, but primarily in brackish water for *A. quadracus*. In all species, most individuals are mature by their first year of age. However, reproductive maturity is not recognized until the spring/early summer prior to breeding when temperature and/or photoperiod trigger this condition (Wooten 1976, Wooten 1984).

- **Northern pipefish:** Male pipefish (*Syngnathus fuscus*) brood their young. Upon hatching (about 10 days post-spawning), young pipefish are considered larvae until they reach a length of approximately 20 mm (Hardy 1978). It is assumed that pipefish move to deeper, warmer waters in winter (Bigelow and Schroeder 1953). For the purposes of the ELMR program, spawning refers to mating (M) (female places eggs into male's brood pouch) and the concomitant fertilization of eggs. The egg stage (E) was not considered in this study.

- **Longhorn and shorthorn sculpins:** Both *Myoxocephalus octodecemspinosis* and *M. scorpius* generally prefer salinities >25 ppt (Bigelow and Schroeder 1953, Scott and Scott 1988). Longhorns appear to be the more abundant of the two species in North Atlantic estuaries. Shorthorns tend to be restricted to relatively cold, shallow water, whereas the longhorn has a greater temperature and depth range. Nonetheless, there is considerable overlap in the habi-

tats utilized by both species. There also seems to be some seasonal onshore-offshore movements, particularly by longhorns.

- **White perch:** Relative to the mid-Atlantic, few large populations of *Morone americana* occur in estuaries north of Cape Cod. Nonetheless, this species is abundant in many rivers, lakes and ponds throughout New England. Spawning occurs in fresh water above and below the head of tide, and in low salinity estuarine waters. Juveniles and adults typically remain within estuarine and freshwater areas throughout their lives. In the North Atlantic region, this species is only occasionally seen in the seawater zone, possibly in association with feeding movements. This species is not considered to be a regular component of this zone in the Gulf of Maine even though they are commonly found in higher salinities south of Cape Cod (Bigelow and Schroeder 1953, Stanley and Danie 1983).

- **Striped bass:** *Morone saxatilis* spawn in the spring in tidal freshwater where there is sufficient current. Most of the fish found in Gulf of Maine waters are suspected to spawn to the south in the Hudson River or Chesapeake Bay, but there is some evidence of limited spawning in some northern rivers (e.g., Kennebec/Androscoggin rivers) (Squiers 1990). Therefore, most of the striped bass in the North Atlantic seem to be involved in a coastal feeding migration, not a spawning migration. Females mature at 4-5 years old, whereas males do so at 2-3 years. Studies in the mid-Atlantic indicate that most juveniles remain in or near their natal rivers until they are mature. Consequently, most of the individuals in the North Atlantic are adults, and a large proportion of these may be female (Fay et al. 1983b, Boreman and Lewis 1987). Johnson (1987) listed striped bass as a species of special concern in Maine.

- **Bluefish:** Adult *Pomatomus saltatrix* are found in estuaries throughout the Gulf of Maine, but juveniles are primarily found south of Maine (Bigelow and Schroeder 1953). Schools migrate north to feed in the summer months and their distribution tends to be patchy, with high intra- and interannual variability. Spawning, egg and larval development occur primarily offshore and south of Cape Cod.

- **Tautog and cunner:** Both *Tautoga onitis* and *T. adspersus* are found in rocky areas, eelgrass beds, and other areas with significant habitat structure and tend to be solitary or in small groups. Both are also active daytime feeders and tend to be less active at night and in winter months. As the temperature decreases, both species become torpid within shelters and there is some movement to deeper water. This seasonal movement is greatest in adult tautogs (Olla et

al. 1974, Auster 1989). In general, cunner and juvenile tautogs have a home range of less than several hundred meters and are assumed to remain in a particular system even though they may be relatively "uncatchable" in the winter. These species are generally found in >25 ppt but both species occasionally enter brackish water. Competition for shelter may be a limiting factor in some areas. Tautog are much more common south of Massachusetts Bay. In the northern Gulf of Maine it is unclear if there are established populations of tautog, however, there are some reports of juveniles, eggs and larvae in systems as far north as Penobscot Bay (Alexander 1976, B. Blackwell, pers. comm.). It is possible that these are rare exogenous specimens that can survive during the warmer months of the year.

- **Ocean pout:** *Macrozoarces americanus* prefers sand/sand-gravel areas and depths of 15-80 m. In the late summer, they stop feeding and move to rocky areas to spawn in the early fall. They are typically unavailable to the fishery during this time, while they guard their eggs for the 2.5-3.5 month incubation period. Nonetheless, we assume that they are still present in the system even though their catchability is reduced. The southern stock is considered to extend from Cape Cod Bay south to Delaware, and a second stock from Cape Elizabeth east to the Bay of Fundy (NEFSC 1992).

- **Sand lance:** *Ammodytes americanus* are also called sand eels. This species may co-occur with *Ammodytes dubius* in some areas. Adults and juveniles can be found in <25 ppt, but tolerance of low salinity seems to decrease with increasing age. This species is difficult to sample due to its burrowing behavior and heavy schooling. Ichthyoplankton surveys suggest that spawning occurs primarily inshore, but there is some evidence of later offshore spawning. Demersal eggs are laid in, or on, sand or gravel. Spawning is seldom observed, but it is inferred from egg/larval presence and/or proper habitat. Larvae are planktonic for 2-3 months before settling and then burrowing into the bottom. Sand lance generally mature in 1-2 years (Bigelow and Schroeder 1953, Auster and Stewart 1986). Sampling indicates that peak abundance occurs in the summer months and that sand lance are rare to absent in many inshore areas in the winter. However, because most spawning occurs inshore in the winter, we assume that this species is present year-round in most of the systems studied, but simply unavailable to the sampling gear used.

- **American plaice and yellowtail flounder:** Both *Hippoglossoides platessoides* and *Pleuronectes ferrugineus* are primarily marine and caught in relatively deep water (Bigelow and Schroeder 1953). How-

ever, they can be common to highly abundant in seawater zones (>25 ppt) and just outside of many estuary mouths. *Hippoglossoides platessoides* is also known as dab.

- **Winter flounder:** *Pleuronectes americanus* is also called blackback or lemon sole. This species may move out of shallow areas in the summer months if waters become too warm (Buckley 1989). Demersal eggs are seldom mentioned in ichthyoplankton work, as is true of other species with demersal eggs. Although winter flounder are still one of the most important commercial species in the region and have dominated recent trawl surveys, historic data indicate that the Gulf of Maine population has waned considerably (NEFSC 1992).

Appendix 4. Table of references and personal communications

Species	Passamaquoddy Bay
Blue mussel <i>Mytilus edulis</i>	59, 77, 264, 311, 419, Beal, Clifford, Dadswell, Hargrave, Kraus, Moring
Sea scallop <i>Pecten magellanicus</i>	34, 59, 107, 120, 333, 379, Beal, Clifford, Dadswell, Hargrave, Kraus, Moring, Robinson
American oyster <i>Crassostrea virginica</i>	142, 158, 240, 419, Beal, Clifford, Hargrave, Kraus, Moring
Northern quahog <i>Mercenaria mercenaria</i>	59, 419, Beal, Clifford, Dadswell, Hargrave, Kraus, Moring, Robinson
Softshell clam <i>Mya arenaria</i>	59, 142, 348, 349, 419, Beal, Clifford, Dadswell, Hargrave, Kraus, Moring, Robinson
Grass shrimp <i>Palaeomonetes pugio</i>	142, 212, 336, 419, 433, Beal, Clifford, Pohle, Hargrave, Kraus, Lawton, Dadswell, Moring
Northern shrimp <i>Pandalus borealis</i>	79, 142, 182, 380, 433, Beal, Clifford, Pohle, Hargrave, Kraus, Lawton, Moring
Sevenspine bay shrimp <i>Crangon septemspinosa</i>	99, 100, 176, 419, Beal, Clifford, Hargrave, Kraus, Lawton, Moring
American lobster <i>Homarus americanus</i>	16, 59, 64, 142, 171, 196, 217, 351, 433, Beal, Dadswell, Hargrave, Kraus, Krouse, Lawton, Pohle
Jonah crab <i>Cancer borealis</i>	142, 219, 362, Beal, Clifford, Dadswell, Hargrave, Kraus, Lawton, Pohle
Atlantic rock crab <i>Cancer irroratus</i>	142, 216, 218, 219, 362, 419, 433, Clifford, Hargrave, Kraus, Krouse, Lawton, Dadswell, Pohle
Green crab <i>Carcinus maenas</i>	4, 50, 83, 419, 433, Beal, Clifford, Dadswell, Hargrave, Kraus, Lawton, Moring, Pohle
Green sea urchin <i>Strongylocentrotus droebachiensis</i>	78, 185, 186, 221, 256, 305, 352, Beal, Clifford, Dadswell, Hargrave, Kraus, Moring, Robinson
Spiny dogfish <i>Squalus acanthias</i>	51, 255, 421, Clifford, Dadswell, Moring
Skates <i>Raja</i> species	51, 255, 421, Clifford, Dadswell, Moring
Shortnose sturgeon <i>Acipenser brevirostrum</i>	51, 104, 255, 272, 370, 421, Clifford, Dadswell, Jessop, Moring, Squiers
Atlantic sturgeon <i>Acipenser oxyrinchus</i>	42, 51, 150, 255, 370, Clifford, Dadswell, Jessop, Moring, Squiers
American eel <i>Anguilla rostrata</i>	37, 42, 51, 137, 150, 373, Clifford, Dadswell, Jessop, Peterson, Squiers
Blueback herring <i>Alosa aestivalis</i>	42, 150, 206, 255, 370, 421, Beland, Clifford, Dadswell, Jessop, Moring, Squiers
Alewife <i>Alosa pseudoharengus</i>	42, 59, 150, 206, 255, 370, 421, Beal, Beland, Clifford, Dadswell, Jessop, Kraus, Moring, Squiers
American shad <i>Alosa sapidissima</i>	42, 59, 105, 150, 370, Clifford, Dadswell, Jessop, Moring, Squiers
Atlantic menhaden <i>Brevoortia tyrannus</i>	51, 255, 370, 421, Clifford, Dadswell, Moring
Atlantic herring <i>Clupea harengus</i>	101, 165, 166, 250, 255, 280, 281, 400, 411, 412, Clifford, Dadswell, Moring, Power, Stephenson
Rainbow smelt <i>Osmerus mordax</i>	42, 144, 150, 255, 282, 421, Beal, Clifford, Jessop, Kraus, Dadswell, Moring, Squiers
Atlantic salmon <i>Salmo salar</i>	25, 41, 150, 156, 370, Beland, Clifford, Dadswell, Jessop, Kraus, Moring, Squiers
Atlantic cod <i>Gadus morhua</i>	51, 79, 255, 421, Clifford, Dadswell, Moring
Haddock <i>Melanogrammus aeglefinus</i>	51, 255, 274, 421, Clifford, Dadswell, Moring
Silver hake <i>Merluccius bilinearis</i>	51, 255, 421, Clifford, Dadswell, Moring
Atlantic tomcod <i>Microgadus tomcod</i>	51, 255, 398, 421, Clifford, Dadswell, Moring

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Species

Passamaquoddy Bay, continued

Pollock <i>Pollachius virens</i>	51, 79, 255, 368, 421, Clifford, Dadswell, Moring
Red hake <i>Urophycis chuss</i>	51, 255, 370, Clifford, Dadswell, Moring
White hake <i>Urophycis tenuis</i>	51, 255, 265, 370, 421, Clifford, Dadswell, Moring
Mummichog <i>Fundulus heteroclitus</i>	31, 42, 150, 370, Clifford, Dadswell, Moring
Silversides <i>Menidia</i> species	31, 42, 150, 255, 370, 421, Clifford, Dadswell, Jessop, Moring
Fourspine stickleback <i>Apeltes quadratus</i>	28, 255, 440, Clifford, Dadswell, Moring
Threespine stickleback <i>Gasterosteus aculeatus</i>	28, 255, 370, 440, Clifford, Dadswell, Moring
Ninespine stickleback <i>Pungitius pungitius</i>	28, 255, 370, 440, Clifford, Dadswell, Moring
Northern pipefish <i>Syngnathus fuscus</i>	181, 248, 255, 370, Clifford, Dadswell, Moring
Northern searobin <i>Prionotus carolinus</i>	51, 255, 370, 421, Clifford, Dadswell, Moring
Grubby <i>Myoxocephalus aeneus</i>	51, 255, 370, 421, Clifford, Dadswell, Moring
Longhorn sculpin <i>Myoxocephalus octodecemspinosis</i>	51, 255, 370, 421, Clifford, Dadswell, Moring
Shorthorn sculpin <i>Myoxocephalus scorpius</i>	51, 255, 421, Clifford, Dadswell, Moring
White perch <i>Morone americana</i>	42, 51, 150, 255, Clifford, Dadswell, Moring, Squiers
Striped bass <i>Morone saxatilis</i>	42, 51, 150, 370, Clifford, Dadswell, Jessop, Moring, Peterson, Squiers
Bluefish <i>Pomatomus saltatrix</i>	51, 370, Clifford, Dadswell, Moring
Scup <i>Stenotomus chrysops</i>	51, 255, 370, 421, Clifford, Dadswell, Moring
Tautog <i>Tautoga onitis</i>	51, 54, 255, 370, 421, Clifford, Dadswell, Moring
Cunner <i>Tautogolabrus adspersus</i>	29, 51, 370, Clifford, Dadswell, Moring
Ocean pout <i>Macrozoarces americanus</i>	255, 370, 421, Clifford, Dadswell, Moring
Rock gunnel <i>Pholis gunnellus</i>	51, 255, 289, 360, 414, Clifford, Dadswell, Moring
American sandlance <i>Ammodytes americanus</i>	51, 255, 288, 368, 436, Clifford, Dadswell, Moring
Atlantic mackerel <i>Scomber scombrus</i>	51, 255, 370, Clifford, Dadswell, Moring
Butterfish <i>Peprius triacanthus</i>	51, 255, 370, 421, Clifford, Dadswell, Moring
Windowpane flounder <i>Scophthalmus aquosus</i>	51, 255, 370, 421, Clifford, Dadswell, Moring
American plaice <i>Hippoglossoides platessoides</i>	255, 370, 421, Clifford, Dadswell, Moring
Winter flounder <i>Pleuronectes americanus</i>	255, 275, 370, 421, 422, Clifford, Dadswell, Moring
Yellowtail flounder <i>Pleuronectes ferrugineus</i>	51, 255, 370, 421, Clifford, Dadswell, Moring
Smooth flounder <i>Pleuronectes putnami</i>	51, 255, 370, 421, Clifford, Dadswell, Moring

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Appendix 4, continued. Table of references and personal communications

Species	Englishman/Machias Bays
Blue mussel <i>Mytilus edulis</i>	77, 142, 211, 239, 240, 264, 310, 311, 337, 419, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
Sea scallop <i>Pecten magellanicus</i>	34, 47, 142, 253, 295, 333, 337, 379, 419, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
American oyster <i>Crassostrea virginica</i>	142, 158, 337, 371, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
Northern quahog <i>Mercenaria mercenaria</i>	142, 337, 393, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
Softshell clam <i>Mya arenaria</i>	15, 142, 239, 240, 308, 337, 419, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
Grass shrimp <i>Palaemonetes pugio</i>	9, 337, 433, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, Moring
Northern shrimp <i>Pandalus borealis</i>	142, 182, 331, 380, 419, 433, Barr, Clifford, Dearborn, Knowlton, McGowan, Moring
Sevenspine bay shrimp <i>Crangon septemspinosa</i>	99, 100, 129, 142, 176, 337, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
American lobster <i>Homarus americanus</i>	64, 97, 110, 142, 217, 257, 259, 337, 351, 419, Beal, Clifford, Dearborn, Knowlton, Kraus, Krouse, McGowan, Moring
Jonah crab <i>Cancer borealis</i>	142, 201, 218, 219, 259, 337, 433, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, Krouse, McGowan, Moring
Atlantic rock crab <i>Cancer irroratus</i>	52, 142, 216, 218, 219, 362, 433, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, Krouse, McGowan, Moring
Green crab <i>Carcinus maenas</i>	50, 83, 337, 428, 433, 434, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
Green sea urchin <i>Strongylocentrotus droebachiensis</i>	78, 142, 185, 186, 337, 372, 419, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
Spiny dogfish <i>Squalus acanthias</i>	51, 64, 92, 142, 149, 202, 253, 259, 304, 370, 419, Clifford, McGowan, Moring
Skates <i>Raja species</i>	51, 64, 142, 255, 259, 276, 370, 419, 421, Clifford, Moring
Shortnose sturgeon <i>Acipenser brevirostrum</i>	17, 51, 106, 142, 161, 370, 419, Clifford, Marancik, Moring, Squiers
Atlantic sturgeon <i>Acipenser oxyrinchus</i>	17, 51, 142, 161, 255, 370, 405, Clifford, Marancik, Moring, Squiers
American eel <i>Anguilla rostrata</i>	17, 42, 51, 122, 137, 142, 145, 149, 184, 255, 288, 370, 414, Beal, Clifford, Kraus, Marancik, McGowan, Moring, Squiers
Blueback herring <i>Alosa aestivalis</i>	17, 42, 51, 122, 142, 149, 251, 255, 259, 294, 402, 419, Beland, Clifford, Marancik, Moring, Squiers
Alewife <i>Alosa pseudoharengus</i>	17, 42, 51, 122, 142, 149, 251, 255, 259, 294, 402, 419, 421, Beal, Clifford, Kraus, Marancik, Moring, Squiers
American shad <i>Alosa sapidissima</i>	17, 42, 51, 108, 122, 142, 149, 255, 419, 427, Beland, Clifford, Marancik, McGowan, Moring, Squiers
Atlantic menhaden <i>Brevoortia tyrannus</i>	51, 118, 142, 354, 419, Clifford, McGowan, Moring, Squiers
Atlantic herring <i>Clupea harengus</i>	64, 68, 80, 101, 102, 166, 167, 168, 208, 381, 396, 414, 415, 416, 417, Beal, Clifford, Kraus, McGowan, Moring, Squiers
Rainbow smelt <i>Osmorus mordax</i>	17, 42, 51, 64, 122, 142, 149, 169, 255, 259, 414, 419, 421, Beal, Clifford, Kraus, McGowan, Moring, Squiers
Atlantic salmon <i>Salmo salar</i>	17, 24, 25, 42, 42, 109, 122, 142, 149, 358, Beal, Beland, Clifford, Kraus, Marancik, McGowan, Moring, Squiers
Atlantic cod <i>Gadus morhua</i>	51, 64, 142, 255, 259, 370, 419, 421, Clifford, McGowan, Moring
Haddock <i>Melanogrammus aeglefinus</i>	51, 53, 142, 255, 259, 370, 419, 421, Clifford, Moring
Silver hake <i>Merluccius bilinearis</i>	8, 51, 64, 142, 255, 259, 370, 419, 421, Clifford, Moring
Atlantic tomcod <i>Microgadus tomcod</i>	42, 51, 122, 142, 149, 255, 338, 398, 414, Clifford, McGowan, Moring

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Species	Englishman/Machias Bays, continued
Pollock <i>Pollachius virens</i>	51, 64, 118, 142, 255, 259, 269, 288, 419, 421, Clifford, Moring
Red hake <i>Urophycis chuss</i>	51, 142, 159, 255, 259, 265, 302, 419, Clifford, Moring
White hake <i>Urophycis tenuis</i>	51, 64, 138, 142, 255, 259, 265, 288, 302, 419, 421, Clifford, McGowan, Moring
Mummichog <i>Fundulus heteroclitus</i>	2, 42, 51, 118, 122, 142, 149, 169, 255, 288, 419, Beal, Clifford, Kraus, McGowan, Moring
Silversides <i>Menidia species</i>	51, 94, 118, 141, 142, 255, 288, 419, Clifford, McGowan, Moring
Fourspine stickleback <i>Apeltes quadratus</i>	28, 118, 142, 169, 255, 288, 439, 440, Clifford, McGowan, Moring
Threespine stickleback <i>Gasterosteus aculeatus</i>	28, 42, 51, 118, 122, 142, 149, 169, 255, 288, 435, 439, 440, Clifford, McGowan, Moring
Ninespine stickleback <i>Pungitius pungitius</i>	28, 42, 51, 118, 122, 142, 149, 169, 288, 439, 440, Clifford, McGowan, Moring
Northern pipefish <i>Syngnathus fuscus</i>	51, 142, 248, 255, Beal, Clifford, Kraus, Moring
Northern searobin <i>Prionotus carolinus</i>	51, 142, 350, Clifford, Kraus, Moring
Grubby <i>Myoxocephalus aeneus</i>	51, 142, 255, 259, 288, 414, Clifford, Moring
Longhorn sculpin <i>Myoxocephalus octodecemspinosis</i>	51, 64, 142, 255, 259, 288, 414, 415, 419, 421, Beal, Clifford, Kraus, McGowan, Moring
Shorthorn sculpin <i>Myoxocephalus scorpius</i>	51, 64, 142, 255, 259, 288, 414, 415, Beal, Clifford, Kraus, McGowan, Moring
White perch <i>Morone americana</i>	42, 51, 122, 142, 149, 169, 392, Clifford, Marancik, McGowan, Moring
Striped bass <i>Morone saxatilis</i>	17, 42, 56, 122, 140, 142, 149, 419, 426, Clifford, Marancik, McGowan, Moring
Bluefish <i>Pomatomus saltatrix</i>	42, 51, 122, 142, 149, 287, 327, 419, Clifford, McGowan, Moring
Scup <i>Stenotomus chrysops</i>	51, 142, 290, 419, Clifford, McGowan, Moring
Tautog <i>Tautoga onitis</i>	29, 51, 142, 419, Clifford, Moring
Cunner <i>Tautogolabrus adspersus</i>	29, 51, 142, 288, 419, Clifford, McGowan, Moring
Ocean pout <i>Macrozoarces americanus</i>	51, 64, 142, 255, 259, 419, 421, Clifford, McGowan, Moring
Rock gunnel <i>Pholis gunnellus</i>	51, 142, 255, 288, 289, 360, 414, 415, Beal, Clifford, Kraus, McGowan, Moring
American sandlance <i>Ammodytes americanus</i>	30, 51, 142, 255, 288, 306, 382, 414, 419, 436, Beal, Clifford, Kraus, McGowan, Moring
Atlantic mackerel <i>Scomber scombrus</i>	42, 51, 64, 122, 142, 149, 255, 259, 419, Beal, Clifford, Kraus, Moring
Butterfish <i>Peprilus triacanthus</i>	51, 64, 142, 255, 259, 296, 419, Clifford, Moring
Windowpane flounder <i>Scophthalmus aquosus</i>	51, 64, 142, 255, 259, Clifford, Moring
American plaice <i>Hippoglossoides platessoides</i>	51, 142, 255, 259, 419, 421, Clifford, McGowan, Moring
Winter flounder <i>Pleuronectes americanus</i>	63, 64, 142, 255, 259, 275, 288, 414, 419, 421, 422, Clifford, McGowan, Moring
Yellowtail flounder <i>Pleuronectes ferrugineus</i>	51, 64, 118, 142, 255, 259, 419, Clifford, McGowan, Moring
Smooth flounder <i>Pleuronectes putnami</i>	27, 51, 142, 255, 414, Clifford, Moring

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Appendix 4, continued. Table of references and personal communications

Species	Narraguagus Bay
Blue mussel <i>Mytilus edulis</i>	77, 142, 211, 239, 264, 310, 311, 337, 419, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
Sea scallop <i>Placopecten magellanicus</i>	34, 47, 142, 253, 295, 333, 337, 379, 419, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
American oyster <i>Crassostrea virginica</i>	142, 158, 337, 371, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
Northern quahog <i>Mercenaria mercenaria</i>	142, 337, 393, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
Softshell clam <i>Mya arenaria</i>	142, 239, 240, 308, 337, 419, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
Grass shrimp <i>Palaeomonetes pugio</i>	9, 336, 433, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, Moring
Northern shrimp <i>Pandalus borealis</i>	142, 182, 331, 380, 419, 433, Barr, Clifford, Dearborn, Knowlton, McGowan, Moring
Sevenspine bay shrimp <i>Crangon septemspinosa</i>	99, 100, 129, 142, 176, 337, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
American lobster <i>Homarus americanus</i>	64, 97, 110, 142, 217, 257, 259, 337, 351, 419, Beal, Clifford, Dearborn, Knowlton, Kraus, Krouse, McGowan, Moring
Jonah crab <i>Cancer borealis</i>	142, 201, 218, 219, 259, 337, 433, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, Krouse, McGowan, Moring
Atlantic rock crab <i>Cancer irroratus</i>	52, 142, 216, 218, 219, 337, 362, 433, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, Krouse, McGowan, Moring
Green crab <i>Carcinus maenas</i>	50, 83, 337, 428, 433, 434, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
Green sea urchin <i>Strongylocentrotus droebachiensis</i>	78, 142, 185, 186, 337, 372, 419, Barr, Beal, Clifford, Dearborn, Knowlton, Kraus, McGowan, Moring
Spiny dogfish <i>Squalus acanthias</i>	39, 51, 64, 92, 142, 202, 255, 259, 304, 370, 419, Clifford, McGowan, Moring
Skates <i>Raja species</i>	51, 64, 142, 255, 259, 276, 370, 419, 421, Clifford, Moring
Shortnose sturgeon <i>Acipenser brevirostrum</i>	17, 51, 106, 142, 161, 370, 419, Clifford, Marancik, Moring, Squiers
Atlantic sturgeon <i>Acipenser oxyrinchus</i>	17, 51, 142, 161, 255, 370, 405, Clifford, Marancik, Moring, Squiers
American eel <i>Anguilla rostrata</i>	17, 39, 51, 123, 137, 142, 145, 184, 255, 288, 370, 414, Beal, Clifford, Kraus, Marancik, McGowan, Moring, Squiers
Blueback herring <i>Alosa aestivalis</i>	17, 39, 51, 123, 142, 251, 255, 259, 294, 402, 419, Beland, Clifford, Marancik, Moring, Squiers
Alewife <i>Alosa pseudoharengus</i>	17, 39, 51, 123, 142, 251, 255, 259, 294, 402, 419, 421, Beal, Clifford, Kraus, Marancik, Moring, Squiers
American shad <i>Alosa sapidissima</i>	17, 39, 51, 108, 123, 142, 255, 419, 427, Beland, Clifford, Marancik, McGowan, Moring, Squiers
Atlantic menhaden <i>Brevoortia tyrannus</i>	51, 118, 142, 354, 419, Clifford, McGowan, Moring, Squiers
Atlantic herring <i>Clupea harengus</i>	51, 68, 80, 101, 102, 165, 166, 167, 168, 208, 396, 414, 415, 416, 417, Beal, Clifford, Kraus, McGowan, Moring, Squiers
Rainbow smelt <i>Osmorus mordax</i>	17, 39, 51, 64, 64, 123, 142, 144, 169, 255, 259, 414, 419, 421, Beal, Clifford, Kraus, McGowan, Moring, Squiers
Atlantic salmon <i>Salmo salar</i>	17, 24, 25, 39, 40, 42, 51, 109, 123, 142, 255, 358, 419, Beal, Beland, Clifford, Kraus, Marancik, McGowan, Moring, Squiers
Atlantic cod <i>Gadus morhua</i>	51, 64, 142, 255, 259, 370, 419, 421, Clifford, McGowan, Moring
Haddock <i>Melanogrammus aeglefinus</i>	51, 53, 142, 255, 259, 370, 419, 421, Clifford, Moring
Silver hake <i>Merluccius bilinearis</i>	8, 51, 64, 142, 255, 259, 370, 419, 421, Clifford, Moring
Atlantic tomcod <i>Microgadus tomcod</i>	40, 51, 123, 142, 255, 338, 398, 414, Clifford, McGowan, Moring

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Species

Narraguagus Bay, continued

Pollock <i>Pollachius virens</i>	51, 64, 118, 142, 255, 259, 269, 288, 419, 421, Clifford, Moring
Red hake <i>Urophycis chuss</i>	51, 142, 159, 255, 259, 265, 302, 419, Clifford, Moring
White hake <i>Urophycis tenuis</i>	51, 64, 138, 142, 255, 259, 265, 288, 302, 419, 421, Clifford, McGowan, Moring

White hake <i>Urophycis tenuis</i>	7, 21, 51, 64, 79, 315, 317, McGowan, Moring
Mummichogs <i>Fundulus heteroclitus</i>	7, 21, 31, 37, 317, Dearborn, McGowan, Moring
Silversides <i>Menidia</i> species	7, 21, 31, 315, 317, Moring
Fourspine stickleback <i>Apeltes quadratus</i>	7, 21, 28, 315, 317, 440, McGowan, Moring
Threespine stickleback <i>Gasterosteus aculeatus</i>	7, 21, 28, 315, 317, 440, McGowan, Moring
Ninespine stickleback <i>Pungitius pungitius</i>	7, 28, 315, 317, 440, McGowan, Moring
Northern pipefish <i>Syngnathus fuscus</i>	7, 181, 248, 315, Moring
Northern searobin <i>Prionotus carolinus</i>	7, 51, 64, 315, 317, 421, Moring
Grubby <i>Myoxocephalus aeneus</i>	7, 21, 51, 315, 317, Moring
Longhorn sculpin <i>Myoxocephalus octodecemspinosis</i>	7, 21, 51, 64, 259, 315, 317, McGowan, Moring
Shorthorn sculpin <i>Myoxocephalus scorpius</i>	7, 21, 51, 64, 315, 317, McGowan, Moring
White perch <i>Morone americana</i>	7, 37, 51, Marancik, McGowan, Moring, Squiers
Striped bass <i>Morone saxatilis</i>	7, 37, Baum, Marancik, Moring, Spencer, Squiers
Bluefish <i>Pomatomus saltatrix</i>	7, 21, 51, 315, McGowan, Moring
Scup <i>Stenotomus chrysops</i>	7, 21, 51, 259, 315, 317, Moring
Tautog <i>Tautoga onitis</i>	7, 21, 51, 315, 317, Blackwell, Moring
Cunner <i>Tautogolabrus adspersus</i>	7, 29, 51, McGowan, Moring
Ocean pout <i>Macrozoarces americanus</i>	7, 21, 64, 259, 315, 317, 421, McGowan, Moring
Rock gunnel <i>Pholis gunnellus</i>	7, 21, 51, 289, 315, 360, 414, McGowan, Moring
American sandlance <i>Ammodytes americanus</i>	7, 21, 51, 288, 315, 317, 436, McGowan, Moring
Atlantic mackerel <i>Scomber scombrus</i>	7, 21, 51, 291, 315, McGowan, Moring
Butterfish <i>Pepilus triacanthus</i>	7, 51, 64, 79, 259, 315, Moring
Windowpane flounder <i>Scophthalmus aquosus</i>	7, 21, 315, Moring
American plaice <i>Hippoglossoides platessoides</i>	7, 21, 64, 79, 259, 315, McGowan, Moring
Winter flounder <i>Pleuronectes americanus</i>	7, 64, 79, 259, 315, Moring
Yellowtail flounder <i>Pleuronectes ferrugineus</i>	7, 21, 64, 79, 259, 315, 421, McGowan, Moring
Smooth flounder <i>Pleuronectes putnami</i>	7, 51, 79, 259, 315, 317, 421, Moring

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Appendix 4, continued. Table of references and personal communications

Species	Muscongus Bay
Blue mussel <i>Mytilus edulis</i>	77, 260, 311, 343, Chenoweth, Larsen, Moring, Shumway
Sea scallop <i>Placopecten magellanicus</i>	34, 142, 264, 295, 379, Chenoweth, Larsen, Moring, Schick, Shumway
American oyster <i>Crassostrea virginica</i>	142, 158, 240, 419, Chenoweth, Larsen, Moring, Shumway
Northern quahog <i>Mercenaria mercenaria</i>	71, 239, 393, 419, Chenoweth, Larsen, Moring, Shumway
Softshell clam <i>Mya arenaria</i>	71, 142, 260, 419, Chenoweth, Larsen, Moring, Shumway
Grass shrimp <i>Palaemonetes pugio</i>	142, 163, 336, 399, 419, 433, Chenoweth, Larsen, Moring, Shumway
Northern shrimp <i>Pandalus borealis</i>	142, 182, 259, 380, 419, 433, Chenoweth, Larsen, Moring, Schick, Shumway
Sevenspine bay shrimp <i>Crangon septemspinosa</i>	129, 176, 419, 433, Chenoweth, Larsen, Moring, Shumway
American lobster <i>Homarus americanus</i>	16, 142, 196, 217, 220, 419, 433, Chenoweth, Krouse, Larsen, Moring, Shumway
Jonah crab <i>Cancer borealis</i>	142, 218, 260, 362, 399, 419, 433, Chenoweth, Krouse, Larsen, Moring, Shumway
Atlantic rock crab <i>Cancer irroratus</i>	142, 216, 218, 219, 260, 362, 399, 419, 433, Chenoweth, Krouse, Larsen, Moring, Shumway
Green crab <i>Carcinus maenas</i>	4, 50, 83, 419, 433, Chenoweth, Krouse, Larsen, Moring, Shumway
Green sea urchin <i>Strongylocentrotus droebachiensis</i>	78, 186, 325, 419, Chenoweth, Larsen, Moring, Shumway
Spiny dogfish <i>Squalus acanthias</i>	51, 154, 172, 259, 260, 419, Chenoweth, Langton, Moring
Skates <i>Raja species</i>	51, 154, 227, 259, 260, Chenoweth, Moring
Shortnose sturgeon <i>Acipenser brevirostrum</i>	51, 142, 155, 272, 386, 399, 419, Chenoweth, Moring, Squiers
Atlantic sturgeon <i>Acipenser oxyrinchus</i>	51, 142, 155, 272, 386, 399, 419, Chenoweth, Moring, Squiers
American eel <i>Anguilla rostrata</i>	51, 76, 260, 283, 373, Chenoweth, Moring, Squiers
Blueback herring <i>Alosa aestivalis</i>	142, 260, 345, 419, Chenoweth, Moring, Squiers
Alewife <i>Alosa pseudoharengus</i>	142, 260, 345, 419, Chenoweth, Libby, Moring, Squiers
American shad <i>Alosa sapidissima</i>	260, 345, 387, Chenoweth, Moring, Squiers
Atlantic menhaden <i>Brevoortia tyrannus</i>	51, 76, 142, 260, 345, 419, Chenoweth, Moring, Nutting, Stevenson
Atlantic herring <i>Clupea harengus</i>	51, 76, 142, 345, 404, 419, Chenoweth, Moring, Nutting, Stevenson
Rainbow smelt <i>Osmorus mordax</i>	51, 76, 144, 260, 282, 345, 370, Chenoweth, Moring, Squiers
Atlantic salmon <i>Salmo salar</i>	41, 260, 283, Chenoweth, Moring, Squiers
Atlantic cod <i>Gadus morhua</i>	51, 76, 154, 225, 226, 227, 228, 229, 232, 259, 260, 335, 345, Chenoweth, Moring
Haddock <i>Melanogrammus aeglefinus</i>	51, 53, 76, 225, 226, 227, 228, 229, 232, 259, 335, 383, Chenoweth, Moring
Silver hake <i>Merluccius bilinearis</i>	51, 142, 154, 225, 226, 227, 228, 229, 232, 259, 260, 419, Chenoweth, Moring
Atlantic tomcod <i>Micromesistius tomcod</i>	31, 51, 154, 225, 226, 227, 228, 229, 232, 259, 260, 398, Chenoweth, Moring

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Species	Casco Bay
Blue mussel <i>Mytilus edulis</i>	70, 74, 142, 238, 309, 310, 311, 343, 419, Creaser, Doggett, Goode, Larsen, Shumway, Sterl
Sea scallop <i>Placopecten magellanicus</i>	70, 142, 295, 379, 419, Creaser, Doggett, Goode, Larsen, Shumway, Sterl
American oyster <i>Crassostrea virginica</i>	142, 158, 371, Creaser, Doggett, Goode, Larsen, Shumway, Sterl
Northern quahog <i>Mercenaria mercenaria</i>	142, 393, 419, Creaser, Doggett, Goode, Larsen, Shumway, Sterl
Softshell clam <i>Mya arenaria</i>	67, 142, 238, 308, 419, Creaser, Doggett, Goode, Larsen, Shumway, Sterl
Grass shrimp <i>Palaemonetes pugio</i>	9, 73, 213, 433, Creaser, Doggett, Larsen, Perkins, Shumway, Sterl
Northern shrimp <i>Pandalus borealis</i>	73, 74, 142, 182, 278, 332, 380, 419, 433, Creaser, Doggett, Goode, Larsen, Perkins, Shumway, Sterl
Sevenspine bay shrimp <i>Crangon septemspinosa</i>	73, 100, 176, 433, Creaser, Doggett, Goode, Larsen, Perkins, Shumway, Sterl
American lobster <i>Homarus americanus</i>	70, 73, 97, 142, 217, 324, 325, 419, Creaser, Doggett, Goode, Krouse, Larsen, Perkins, Shumway, Sterl
Jonah crab <i>Cancer borealis</i>	73, 75, 142, 175, 201, 219, 238, 325, 433, Creaser, Doggett, Goode, Krouse, Larsen, Perkins, Shumway, Sterl
Atlantic rock crab <i>Cancer irroratus</i>	52, 73, 75, 142, 201, 216, 219, 238, 325, 433, Creaser, Doggett, Goode, Krouse, Larsen, Perkins, Shumway, Sterl
Green crab <i>Carcinus maenas</i>	50, 73, 83, 355, 428, 433, Creaser, Doggett, Goode, Larsen, Perkins, Shumway, Sterl
Green sea urchin <i>Strongylocentrotus droebachiensis</i>	78, 185, 186, 238, 293, 372, 419, Creaser, Doggett, Goode, Larsen, Shumway, Sterl
Spiny dogfish <i>Squalus acanthias</i>	51, 70, 73, 142, 202, 304, 325, 345, 419, Goode, Langton, Perkins
Skates <i>Raja species</i>	51, 70, 73, 142, 232, 260, 276, 370, 419, Goode, Langton, Perkins
Shortnose sturgeon <i>Acipenser brevirostrum</i>	51, 106, 142, 161, 370, 419, Goode, Langton, Perkins, Squiers
Atlantic sturgeon <i>Acipenser oxyrinchus</i>	51, 142, 161, 370, 405, Goode, Langton, Perkins, Squiers
American eel <i>Anguilla rostrata</i>	31, 51, 76, 137, 142, 184, 370, Goode, Langton, Perkins, Squiers
Blueback herring <i>Alosa aestivalis</i>	31, 51, 70, 142, 251, 260, 294, 345, 370, 419, Goode, Squiers,
Alewife <i>Alosa pseudoharengus</i>	31, 51, 70, 74, 142, 251, 294, 370, 404, 419, Goode, Squiers
American shad <i>Alosa sapidissima</i>	51, 108, 142, 260, 345, 370, 419, 427, Goode, Squiers
Atlantic menhaden <i>Brevoortia tyrannus</i>	51, 70, 74, 142, 260, 345, 354, 370, 419, Chenoweth, Goode
Atlantic herring <i>Clupea harengus</i>	31, 70, 73, 76, 101, 102, 142, 166, 167, 168, 208, 381, 404, 419, Chenoweth, Goode
Rainbow smelt <i>Osmorus mordax</i>	31, 51, 62, 70, 73, 76, 142, 260, 345, 370, 419, Goode, Squiers
Atlantic salmon <i>Salmo salar</i>	24, 25, 41, 51, 109, 142, Goode, Squiers,
Atlantic cod <i>Gadus morhua</i>	51, 70, 73, 74, 76, 142, 320, 321, 325, 335, 370, 419, Goode, Langton, Perkins
Haddock <i>Melanogrammus aeglefinus</i>	51, 53, 74, 142, 320, 321, 335, 370, 419, Goode, Langton, Perkins
Silver hake <i>Merluccius bilinearis</i>	51, 70, 73, 74, 76, 142, 232, 260, 321, 370, 419, Goode, Langton, Perkins
Atlantic tomcod <i>Microgadus tomcod</i>	31, 51, 70, 73, 142, 260, 370, 398, 404, Goode, Langton, Perkins

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Species **Casco Bay, continued**

Pollock <i>Pollachius virens</i>	51, 70, 73, 74, 142, 269, 325, 370, 419, Goode, Langton, Perkins

Atlantic mackerel <i>Scomber scombrus</i>	51, 70, 74, 121, 142, 260, 324, 325, 345, 346, 370, 419, Chenoweth, Goode, Squiers
Butterfish <i>Peprius triacanthus</i>	51, 70, 142, 296, 297, 370, 419, Chenoweth, Goode, Squiers
Windowpane flounder <i>Scophthalmus aquosus</i>	51, 70, 74, 76, 142, 232, 260, 346, 370, Goode, Langton, Perkins
American plaice <i>Hippoglossoides platessoides</i>	51, 70, 74, 142, 232, 335, 370, 419, Goode, Langton, Perkins
Winter flounder <i>Pleuronectes americanus</i>	27, 31, 51, 63, 70, 74, 142, 275, 346, 370, 404, 419, Goode, Langton, Perkins
Yellowtail flounder <i>Pleuronectes ferrugineus</i>	51, 70, 74, 76, 142, 232, 320, 321, 370, 419, Goode, Langton, Perkins
Smooth flounder <i>Pleuronectes putnami</i>	27, 31, 51, 142, 234, 260, 370, 404, Langton, Perkins

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Appendix 4, continued. Table of references and personal communications

Species	Wells Harbor
Blue mussel <i>Mytilus edulis</i>	142, 238, 309, 310, 311, 343, 419, Dionne, Sterl
Sea scallop <i>Placopecten magellanicus</i>	142, 295, 379, 419, Dionne, Sterl
American oyster <i>Crassostrea virginica</i>	142, 158, 371, Dionne, Sterl
Northern quahog <i>Mercenaria mercenaria</i>	393, 419, Sterl
Softshell clam <i>Mya arenaria</i>	142, 162, 238, 308, 419, Dionne, Sterl
Grass shrimp <i>Palaemonetes pugio</i>	9, 213, 312, 429, 433, Dionne, Sterl
Northern shrimp <i>Pandalus borealis</i>	142, 182, 278, 332, 380, 419, 433, Dionne, Sterl
Sevenspine bay shrimp <i>Crangon septemspinosa</i>	100, 162, 176, 433, Dionne, Sterl
American lobster <i>Homarus americanus</i>	1, 97, 142, 162, 217, 257, 419, Dionne, Sterl
Jonah crab <i>Cancer borealis</i>	75, 142, 175, 201, 219, 433, Dionne, Sterl
Atlantic rock crab <i>Cancer irroratus</i>	52, 75, 142, 201, 216, 219, 433, Dionne, Sterl
Green crab <i>Carcinus maenas</i>	50, 83, 162, 355, 428, 433, Dionne, Sterl
Green sea urchin <i>Strongylocentrotus droebachiensis</i>	78, 185, 186, 293, 372, 419, Dionne, Sterl
Spiny dogfish <i>Squalus acanthias</i>	51, 142, 202, 304, 345, 370, 419, Dionne, Sterl
Skates <i>Raja</i> species	51, 142, 232, 276, 370, 419, Dionne, Sterl
Shortnose sturgeon <i>Acipenser brevirostrum</i>	51, 106, 142, 161, 370, 419, Dionne, Sterl
Atlantic sturgeon <i>Acipenser oxyrinchus</i>	51, 142, 161, 370, 405, Dionne, Sterl
American eel <i>Anguilla rostrata</i>	31, 51, 76, 114, 137, 142, 184, 370, Dionne, Sterl
Blueback herring <i>Alosa aestivalis</i>	31, 51, 114, 142, 251, 294, 345, 370, 419, Dionne, Sterl
Alewife <i>Alosa pseudoharengus</i>	31, 51, 114, 142, 251, 294, 345, 370, 404, 419, Dionne, Sterl
American shad <i>Alosa sapidissima</i>	51, 108, 142, 345, 370, 419, 427, Dionne, Sterl
Atlantic menhaden <i>Brevoortia tyrannus</i>	51, 142, 345, 354, 370, 419, Dionne, Sterl
Atlantic herring <i>Clupea harengus</i>	31, 51, 102, 114, 142, 166, 208, 249, 370, 404, 419, Dionne, Sterl
Rainbow smelt <i>Osmerus mordax</i>	31, 51, 62, 76, 114, 142, 345, 370, 419, Dionne, Sterl
Atlantic salmon <i>Salmo salar</i>	24, 25, 41, 51, 109, 142, Dionne
Atlantic cod <i>Gadus morhua</i>	51, 76, 142, 335, 370, 419, Dionne, Sterl
Haddock <i>Melanogrammus aeglefinus</i>	51, 53, 142, 335, 370, 419, Dionne, Sterl
Silver hake <i>Merluccius bilinearis</i>	51, 76, 142, 232, 370, 419, Dionne, Sterl
Atlantic tomcod <i>Microgadus tomcod</i>	31, 51, 114, 142, 370, 398, 404, Dionne, Sterl

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Species **Wells Harbor, continued**

Pollock <i>Pollachius virens</i>	51, 142, 162, 269, 370, 419, Dionne, Sterl
Red hake <i>Urophycis chuss</i>	51, 142, 232, 265, 302, 370, Sterl
White hake <i>Urophycis tenuis</i>	31, 51, 114, 138, 142, 232, 265, 302, 370, 419, Sterl
Mummichogs <i>Fundulus heteroclitus</i>	2, 31, 51, 114, 142, 301, 370, 404, 419, Dionne, Sterl
Silversides <i>Menidia</i> species	31, 51, 94, 114, 141, 142, 370, 404, 419, Dionne, Sterl
Fourspine stickleback <i>Apeltes quadratus</i>	28, 31, 51, 114, 142, 370, 404, 439, 440, Dionne, Sterl
Threespine stickleback <i>Gasterosteus aculeatus</i>	28, 31, 51, 114, 142, 370, 404, 439, 440, Dionne, Sterl
Ninespine stickleback <i>Pungitius pungitius</i>	28, 31, 51, 114, 142, 370, 404, 439, 440, Dionne, Sterl
Northern pipefish <i>Syngnathus fuscus</i>	31, 51, 76, 114, 142, 248, 370, Dionne, Sterl
Northern searobin <i>Prionotus carolinus</i>	51, 142, 350, 370, Dionne, Sterl
Grubby <i>Myoxocephalus aeneus</i>	31, 51, 114, 142, 370, Sterl
Longhorn sculpin <i>Myoxocephalus octodecemspinosis</i>	51, 76, 142, 232, 235, 370, 419, Dionne, Sterl
Shorthorn sculpin <i>Myoxocephalus scorpius</i>	51, 76, 142, 235, 370, Dionne, Sterl
White perch <i>Morone americana</i>	51, 142, 370, 392, Dionne, Sterl
Striped bass <i>Morone saxatilis</i>	51, 56, 140, 142, 162, 370, 419, 426, Dionne, Sterl
Bluefish <i>Pomatomus saltatrix</i>	51, 142, 287, 327, 370, 419, Dionne, Sterl
Scup <i>Stenotomus chrysops</i>	51, 142, 290, 370, 419, Sterl
Tautog <i>Tautoga onitis</i>	29, 51, 142, 370, 419, Sterl
Cunner <i>Tautogolabrus adspersus</i>	29, 51, 76, 142, 370, 419, Sterl
Ocean pout <i>Macrozoarces americanus</i>	51, 142, 232, 370, 419, Dionne, Sterl
Rock gunnel <i>Pholis gunnellus</i>	31, 51, 76, 142, 289, 360, 370, Sterl
American sandlance <i>Ammodytes americanus</i>	30, 31, 51, 76, 114, 142, 162, 347, 370, 382, 419, Dionne, Sterl
Atlantic mackerel <i>Scomber scombrus</i>	51, 142, 162, 345, 370, 419, Dionne, Sterl
Butterfish <i>Peprilus triacanthus</i>	51, 142, 296, 297, 370, 419, Dionne, Sterl
Windowpane flounder <i>Scophthalmus aquosus</i>	51, 76, 114, 142, 232, 370, Dionne, Sterl
American plaice <i>Hippoglossoides platessoides</i>	51, 142, 232, 335, 370, 419, Dionne, Sterl
Winter flounder <i>Pleuronectes americanus</i>	27, 31, 51, 63, 114, 142, 232, 275, 370, 404, 419, Dionne, Sterl
Yellowtail flounder <i>Pleuronectes ferrugineus</i>	51, 76, 114, 142, 232, 370, 419, Dionne, Sterl
Smooth flounder <i>Pleuronectes putnami</i>	27, 31, 51, 114, 142, 370, 404, Dionne, Sterl

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Appendix 4, continued. Table of references and personal communications

Species	Great Bay
Blue mussel <i>Mytilus edulis</i>	22, 115, 116, 180, 309, 310, 311, 318, 343, 378, 420, Armstrong, Bowen, Grizzle, Harris, Howell, Nelson, Short
Sea scallop <i>Placopecten magellanicus</i>	142, 295, 318, 379, 420, Armstrong, Bowen, Grizzle, Harris, Howell, Nelson
American oyster <i>Crassostrea virginica</i>	22, 115, 116, 180, 200, 371, 378, 420, Armstrong, Bowen, Grizzle, Howell, Nelson, Short
Northern quahog <i>Mercenaria mercenaria</i>	115, 116, 378, 393, Armstrong, Bowen, Grizzle, Howell, Nelson
Softshell clam <i>Mya arenaria</i>	22, 61, 115, 116, 180, 200, 308, 318, 378, 420, Armstrong, Bowen, Grizzle, Howell, Nelson, Short
Grass shrimp <i>Palaemonetes pugio</i>	9, 213, 312, 433, Armstrong, Bowen, Gestring, Howell, Nelson, Short
Northern shrimp <i>Pandalus borealis</i>	182, 278, 332, 380, 433, Armstrong, Bowen, Gestring, Howell, Nelson
Sevenspine bay shrimp <i>Crangon septemspinosa</i>	22, 99, 100, 115, 116, 176, 318, 420, 433, Armstrong, Bowen, Gestring, Howell, Nelson
American lobster <i>Homarus americanus</i>	22, 115, 116, 164, 192, 257, 318, 378, 420, 425, 433, Armstrong, Bowen, Howell, Nelson, Short
Jonah crab <i>Cancer borealis</i>	75, 115, 116, 175, 201, 318, 378, 420, 433, Armstrong, Bowen, Harris, Howell, Nelson, Short
Atlantic rock crab <i>Cancer irrortatus</i>	22, 52, 75, 115, 116, 201, 216, 318, 378, 420, 433, Armstrong, Bowen, Harris, Howell, Nelson, Short
Green crab <i>Carcinus maenas</i>	50, 115, 116, 180, 318, 355, 378, 420, 428, 433, Armstrong, Bowen, Harris, Howell, Nelson, Short
Green sea urchin <i>Strongylocentrotus droebachiensis</i>	180, 372, 420, Armstrong, Bowen, Harris, Howell, Nelson
Spiny dogfish <i>Squalus acanthias</i>	51, 92, 115, 202, 304, 318, 370, Armstrong, Bowen, Gestring, Howell, Nelson
Skates <i>Raja</i> species	51, 115, 116, 276, 318, 370, 378, Armstrong, Bowen, Gestring, Howell, Nelson
Shortnose sturgeon <i>Acipenser brevirostrum</i>	51, 106, 161, 370, Armstrong, Bowen, Gestring, Howell, Nelson
Atlantic sturgeon <i>Acipenser oxyrinchus</i>	51, 115, 161, 200, 370, 378, 405, Armstrong, Bowen, Gestring, Howell, Nelson
American eel <i>Anguilla rostrata</i>	51, 115, 116, 137, 184, 200, 316, 318, 370, 378, Armstrong, Bowen, Gestring, Howell, Nelson
Blueback herring <i>Alosa aestivalis</i>	22, 51, 115, 116, 117, 160, 251, 294, 316, 370, 378, Armstrong, Bowen, Gestring, Howell, Nelson
Alewife <i>Alosa pseudoharengus</i>	3, 22, 51, 115, 116, 117, 160, 224, 251, 294, 370, 378, Armstrong, Bowen, Gestring, Howell, Nelson
American shad <i>Alosa sapidissima</i>	51, 108, 115, 117, 370, 378, 427, Armstrong, Bowen, Howell, Nelson
Atlantic menhaden <i>Brevoortia tyrannus</i>	51, 115, 116, 316, 318, 354, 370, 378, Armstrong, Bowen, Gestring, Howell, Nelson
Atlantic herring <i>Clupea harengus</i>	22, 31, 51, 102, 115, 116, 208, 316, 318, 370, 378, 381, 416, Armstrong, Bowen, Gestring, Howell, Nelson
Rainbow smelt <i>Osmerus mordax</i>	22, 51, 62, 115, 116, 117, 160, 200, 298, 316, 318, 370, 378, Armstrong, Bowen, Gestring, Howell, Nelson
Atlantic salmon <i>Salmo salar</i>	22, 24, 25, 51, 109, 115, 116, 117, 200, 370, 378, Armstrong, Bowen, Gestring, Howell, Nelson
Atlantic cod <i>Gadus morhua</i>	51, 115, 116, 316, 318, 370, 378, Armstrong, Bowen, Gestring, Howell, Nelson
Haddock <i>Melanogrammus aeglefinus</i>	22, 51, 53, 316, 318, 370, Armstrong, Bowen, Gestring, Howell, Nelson
Silver hake <i>Merluccius bilinearis</i>	51, 316, 318, 370, Armstrong, Bowen, Gestring, Howell, Nelson
Atlantic tomcod <i>Micログadus tomcod</i>	22, 51, 115, 116, 160, 200, 316, 318, 338, 370, 378, 398, Armstrong, Bowen, Gestring, Howell, Nelson

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Skates <i>Raja species</i>	51, 84, 205, 318, 320, 321, 356, 370, Bowen, Deegan, Iwanowicz
Shortnose sturgeon <i>Acipenser brevirostrum</i>	84, 106, 161, 209, 210, 370, Deegan, Iwanowicz, Keiffer
Atlantic sturgeon <i>Acipenser oxyrinchus</i>	84, 161, 205, 209, 210, 370, 405, Deegan, Iwanowicz, Keiffer
American eel <i>Anguilla rostrata</i>	137, 184, 205, 314, 339, 356, 370, Bowen, Deegan, Iwanowicz
Blueback herring <i>Alosa aestivalis</i>	51, 84, 197, 203, 205, 251, 294, 314, 339, 370, Bowen, Iwanowicz, Keiffer, Stolte
Alewife <i>Alosa pseudoharengus</i>	51, 84, 203, 205, 251, 294, 314, 339, 370, Bowen, Iwanowicz, Keiffer, Stolte
American shad <i>Alosa sapidissima</i>	51, 108, 126, 197, 314, 320, 321, 356, 370, 427, Bowen, Deegan, Iwanowicz, Keiffer, Stolte
Atlantic menhaden <i>Brevoortia tyrannus</i>	51, 339, 354, 370, Bowen, Deegan, Iwanowicz, Keiffer
Atlantic herring <i>Clupea harengus</i>	51, 102, 208, 249, 318, 339, 370, 381, 416, Bowen, Iwanowicz
Rainbow smelt <i>Osmerus mordax</i>	51, 62, 84, 203, 205, 298, 314, 318, 339, 370, Bowen, Iwanowicz, Keiffer
Atlantic salmon <i>Salmo salar</i>	24, 25, 51, 84, 109, 126, 197, 314, 370, 401, Bowen, Deegan, Iwanowicz, Keiffer, Stolte
Atlantic cod <i>Gadus morhua</i>	51, 84, 205, 318, 320, 321, 339, 356, 370, Bowen, Deegan, Iwanowicz
Haddock <i>Melanogrammus aeglefinus</i>	51, 84, 203, 320, 321, 356, 370, Bowen, Deegan, Iwanowicz
Silver hake <i>Merluccius bilinearis</i>	51, 84, 318, 320, 321, 339, 356, 370, Bowen, Deegan, Iwanowicz
Atlantic tomcod <i>Microgadus tomcod</i>	84, 205, 338, 339, 356, 370, 398, Bowen, Deegan, Iwanowicz

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Species **Merrimack River, continued**

Pollock <i>Pollachius virens</i>	51, 84, 203, 269, 318, 339, 370, Bowen, Deegan, Iwanowicz
Red hake <i>Urophycis chuss</i>	51, 84, 203, 205, 265, 318, 320, 321, 339, 356, 370, Bowen, Deegan, Iwanowicz
White hake <i>Urophycis tenuis</i>	51, 84, 203, 205, 265, 318, 356, 370, Bowen, Deegan, Iwanowicz
Mummichogs <i>Fundulus heteroclitus</i>	2, 51, 84, 203, 205, 318, 370, Bowen, Deegan, Iwanowicz
Silversides <i>Menidia species</i>	51, 84, 95, 96, 141, 203, 205, 370, Bowen, Deegan, Iwanowicz
Fourspine stickleback <i>Apietes quadracus</i>	28, 51, 84, 205, 318, 370, 439, 440, Bowen, Iwanowicz
Threespine stickleback <i>Gasterosteus aculeatus</i>	28, 51, 203, 205, 339, 370, 434, 439, 440, Bowen, Iwanowicz
Ninespine stickleback <i>Pungitius pungitius</i>	28, 51, 84, 203, 205, 370, 439, 440, Bowen, Iwanowicz
Northern pipefish <i>Syngnathus fuscus</i>	51, 84, 203, 205, 248, 339, 370, Bowen, Deegan, Iwanowicz
Northern searobin <i>Prionotus carolinus</i>	51, 84, 339, 350, Bowen, Iwanowicz
Grubby <i>Myoxocephalus aeneus</i>	51, 84, 247, 339, Bowen, Deegan, Iwanowicz
Longhorn sculpin <i>Myoxocephalus octodecemspinosis</i>	51, 84, 205, 235, 339, 370, Bowen, Deegan, Iwanowicz
Shorthorn sculpin <i>Myoxocephalus scorpius</i>	51, 84, 235, 339, 356, 370, Bowen, Iwanowicz
White perch <i>Morone americana</i>	51, 84, 203, 205, 370, 392, Bowen, Iwanowicz, Keiffer
Striped bass <i>Morone saxatilis</i>	51, 56, 84, 140, 197, 203, 320, 321, 370, 426, Bowen, Deegan, Iwanowicz, Keiffer
Bluefish <i>Pomatomus saltatrix</i>	51, 84, 320, 321, 327, Bowen, Deegan, Iwanowicz
Scup <i>Stenotomus chrysops</i>	51, 84, 290, 318, 320, 321, Bowen, Deegan, Iwanowicz
Tautog <i>Tautoga onitis</i>	29, 51, 84, 339, 356, 370, Bowen, Deegan, Iwanowicz
Cunner <i>Tautogolabrus adspersus</i>	29, 51, 84, 339, 356, 370, Bowen, Deegan, Iwanowicz
Ocean pout <i>Macrozoarces americanus</i>	51, 84, 318, 370, Bowen, Iwanowicz
Rock gunnel <i>Pholis gunnellus</i>	51, 84, 339, 370, Bowen, Deegan, Iwanowicz
American sandlance <i>Ammodytes americanus</i>	30, 84, 203, 205, 314, 318, 339, 347, 370, 430, Bowen, Deegan, Iwanowicz
Atlantic mackerel <i>Scomber scombrus</i>	51, 84, 203, 314, 318, 320, 321, 339, 370, Bowen, Iwanowicz
Butterfish <i>Pepilus triacanthus</i>	51, 84, 296, 297, 318, 320, 321, 370, Bowen, Iwanowicz
Windowpane flounder <i>Scophthalmus aquosus</i>	51, 205, 318, 320, 321, 339, 356, 370, Bowen, Deegan, Iwanowicz
American plaice <i>Hippoglossoides platessoides</i>	51, 84, 203, 320, 321, 339, 370, Bowen, Iwanowicz
Winter flounder <i>Pleuronectes americanus</i>	51, 63, 84, 203, 205, 275, 314, 318, 320, 321, 328, 339, 353, 356, 370, Bowen, Deegan, Iwanowicz
Yellowtail flounder <i>Pleuronectes ferrugineus</i>	51, 84, 203, 205, 318, 320, 321, 339, 370, Bowen, Iwanowicz
Smooth flounder <i>Pleuronectes putnami</i>	51, 203, 318, 370, Bowen, Iwanowicz

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Alewife <i>Alosa pseudoharengus</i>	11, 81, 127, 131, 173, 194, 198, 204, 261, 262, Boreman, Brady, Chase, Howe, Hubbard, Scherer
American shad <i>Alosa sapidissima</i>	11, 51, 81, 84, 127, 131, 173, 191, 194, 198, 204, 261, 262, Boreman, Brady, Chase, Howe, Hubbard, Ross, Scherer
Atlantic menhaden <i>Brevoortia tyrannus</i>	11, 81, 127, 131, 173, 194, 198, 204, 261, Chase, Howe, Hubbard, Ross, Scherer
Atlantic herring <i>Clupea harengus</i>	11, 81, 127, 131, 173, 194, 198, 204, 261, Chase, Howe, Hubbard, Ross, Scherer
Rainbow smelt <i>Osmerus mordax</i>	11, 51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Brady, Chase, Howe, Hubbard, Ross, Scherer
Atlantic salmon <i>Salmo salar</i>	24, 25, 51, 81, 84, 127, 131, 173, 194, 198, 204, Boreman, Brady, Chase, Howe, Hubbard, Ross, Scherer
Atlantic cod <i>Gadus morhua</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Ross, Scherer
Haddock <i>Melanogrammus aeglefinus</i>	51, 81, 84, 127, 131, 173, 191, 194, 198, 204, Chase, Howe, Hubbard, Ross, Scherer
Silver hake <i>Merluccius bilinearis</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Ross, Scherer
Atlantic tomcod <i>Microgadus tomcod</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Scherer

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Species

Boston Harbor, continued

Pollock <i>Pollachius virens</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Ross, Scherer
Red hake <i>Urophycis chuss</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Ross, Scherer
White hake <i>Urophycis tenuis</i>	51, 81, 84, 127, 131, 173, 191, 194, 198, 204, Chase, Howe, Hubbard, Ross, Scherer

Ninespine stickleback <i>Pungitius pungitius</i>	11, 51, 81, 84, 127, 131, 173, 194, 198, 204, Chase, Howe, Hubbard
Northern pipefish <i>Syngnathus fuscus</i>	51, 81, 84, 87, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Scherer
Northern searobin <i>Prionotus carolinus</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard
Grubby <i>Myoxocephalus aeneus</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Scherer
Longhorn sculpin <i>Myoxocephalus octodecemspinosis</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Scherer
Shorthorn sculpin <i>Myoxocephalus scorpius</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Scherer
White perch <i>Morone americana</i>	11, 81, 127, 131, 173, 194, 198, 204, 261, 262, Boreman, Brady, Chase, Howe, Hubbard, Ross, Scherer
Striped bass <i>Morone saxatilis</i>	11, 81, 127, 131, 173, 194, 198, 204, 262, Boreman, Brady, Chase, Howe, Hubbard, Ross, Scherer
Bluefish <i>Pomatomus saltatrix</i>	11, 81, 127, 131, 173, 194, 198, 204, 261, 262, Boreman, Chase, Howe, Hubbard, Ross, Scherer
Scup <i>Stenotomus chrysops</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Scherer
Tautog <i>Tautoga onitis</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Ross, Scherer
Cunner <i>Tautogolabrus adspersus</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Ross, Scherer
Ocean pout <i>Macrozoarces americanus</i>	51, 81, 84, 127, 131, 173, 191, 194, 198, 204, Chase, Howe, Hubbard, Ross, Scherer
Rock gunnel <i>Pholis gunnellus</i>	51, 81, 84, 127, 131, 173, 191, 194, 198, 204, Chase, Howe, Hubbard, Scherer
American sandlance <i>Ammodytes americanus</i>	51, 81, 84, 127, 131, 173, 191, 194, 198, 204, Chase, Howe, Hubbard, Scherer
Atlantic mackerel <i>Scomber scombrus</i>	11, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Ross, Scherer
Butterfish <i>Pepinthus triacanthus</i>	11, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Ross, Scherer
Windowpane flounder <i>Scophthalmus aquosus</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Ross, Scherer
American plaice <i>Hippoglossoides platessoides</i>	51, 81, 84, 127, 131, 173, 191, 194, 198, 204, Chase, Howe, Hubbard, Ross, Scherer
Winter flounder <i>Pleuronectes americanus</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Hubbard, Ross, Scherer, Truchon, Howe
Yellowtail flounder <i>Pleuronectes ferrugineus</i>	51, 81, 127, 131, 173, 194, 198, 204, 261, 262, Chase, Howe, Hubbard, Ross, Scherer
Smooth flounder <i>Pleuronectes putnami</i>	51, 81, 84, 127, 131, 173, 194, 198, 204, 370, Chase, Howe, Hubbard, Ross, Scherer

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Appendix 4, continued. Table of references and personal communications

Species	Cape Cod Bay
Blue mussel <i>Mytilus edulis</i>	11, 103, 112, 190, 191, 199, 310, Collings, Deegan, Kelly, Lawton, Toner
Sea scallop <i>Placopecten magellanicus</i>	11, 74, 103, 112, 190, 191, 199, 295, 321, 320, Kelly
American oyster <i>Crassostrea virginica</i>	11, 103, 112, 199, 371, Kelly, Toner
Northern quahog <i>Mercenaria mercenaria</i>	11, 103, 112, 199, 393, Deegan, Kelly, Toner
Softshell clam <i>Mya arenaria</i>	11, 103, 112, 199, 308, Deegan, Kelly, Toner
Grass shrimp <i>Palaeomonetes pugio</i>	9, 11, 112, 213, 312, 429, 433, Deegan, Kelly
Northern shrimp <i>Pandalus borealis</i>	11, 74, 112, 182, 320, 321, 380, 433 Collings, Kelly
Sevenspine bay shrimp <i>Crangon septemspinosa</i>	11, 74, 112, 176, 183, 433, Deegan, Kelly
American lobster <i>Homarus americanus</i>	1, 11, 89, 103, 112, 133, 134, 135, 136, 183, 188, 190, 191, 199, 242, 257, 268, 320, 321, 433, Scherer, Estrella, Kelly, Collings
Jonah crab <i>Cancer borealis</i>	11, 103, 112, 190, 191, 199, 245, 394, 433, Kelly
Atlantic rock crab <i>Cancer irroratus</i>	11, 52, 103, 112, 183, 190, 191, 199, 245, 394, 433, Kelly
Green crab <i>Carcinus maenas</i>	11, 103, 112, 183, 199, 245, 433, Kelly, Deegan
Green sea urchin <i>Strongylocentrotus droebachiensis</i>	11, 112, 372, 395, Kelly
Spiny dogfish <i>Squalus acanthias</i>	11, 51, 74, 84, 92, 103, 112, 190, 191, 199, 202, 245, 304, 320, 321, Currier, Deegan, Kelly, Ross
Skates <i>Raja species</i>	11, 51, 74, 84, 103, 112, 190, 191, 199, 245, 276, 320, 321, Currier, Deegan, Kelly, Ross
Shortnose sturgeon <i>Acipenser brevirostrum</i>	11, 51, 84, 103, 106, 112, 161, 199, 245, Brady, Currier, Deegan, Kelly, Ross
Atlantic sturgeon <i>Acipenser oxyrinchus</i>	11, 103, 112, 199, 245, 161, 405, 51, 84, 320, 321, Brady, Currier, Deegan, Kelly, Ross
American eel <i>Anguilla rostrata</i>	11, 51, 84, 103, 112, 137, 152, 183, 184, 190, 191, 199, 245, Brady, Currier, Deegan, Kelly, Ross, Scherer
Blueback herring <i>Alosa aestivalis</i>	11, 51, 74, 84, 103, 112, 190, 191, 199, 245, 294, 320, 321, Boreman, Brady, Currier, Deegan, Kelly, Scherer
Alewife <i>Alosa pseudoharengus</i>	11, 51, 74, 84, 103, 112, 190, 191, 199, 245, 294, 320, 321, Boreman, Currier, Deegan, Kelly, Scherer
American shad <i>Alosa sapidissima</i>	11, 51, 84, 103, 108, 112, 190, 191, 199, 320, 321, 427, Boreman, Brady, Deegan, Currier, Kelly, Ross
Atlantic menhaden <i>Brevoortia tyrannus</i>	11, 51, 74, 84, 89, 103, 112, 190, 191, 199, 245, 320, 321, 354, Deegan, Collings, Currier, Kelly, Ross, Scherer
Atlantic herring <i>Clupea harengus</i>	11, 51, 74, 84, 103, 112, 183, 190, 191, 199, 208, 245, 320, 321, Collings, Currier, Deegan, Kelly, Ross, Scherer
Rainbow smelt <i>Osmerus mordax</i>	11, 51, 62, 84, 103, 112, 190, 191, 199, 245, Brady, Currier, Deegan, Kelly, Ross, Scherer
Atlantic salmon <i>Salmo salar</i>	11, 24, 25, 51, 84, 103, 109, 112, 199, 245, Boreman, Brady, Currier, Kelly, Ross, Scherer
Atlantic cod <i>Gadus morhua</i>	11, 51, 74, 84, 89, 103, 112, 190, 191, 199, 245, 320, 321, Collings, Currier, Deegan, Kelly, Ross, Scherer
Haddock <i>Melanogrammus aeglefinus</i>	11, 51, 53, 74, 84, 103, 112, 190, 191, 199, 245, 320, 321, Collings, Currier, Deegan, Kelly, Ross, Scherer
Silver hake <i>Merluccius bilinearis</i>	11, 51, 74, 84, 89, 103, 112, 190, 191, 199, 245, 320, 321, Collings, Currier, Deegan, Kelly, Ross, Scherer
Atlantic tomcod <i>Microgadus tomcod</i>	11, 51, 84, 103, 112, 183, 190, 191, 199, 245, 398, Collings, Currier, Deegan, Kelly, Ross, Scherer

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.

Species

Cape Cod Bay, continued

Pollock <i>Pollachius virens</i>	11, 51, 84, 103, 112, 183, 190, 191, 199, 243, 245, 320, 321, Collings, Currier, Deegan, Kelly, Ross, Scherer
Red hake <i>Urophycis chuss</i>	11, 51, 74, 84, 89, 103, 112, 183, 190, 191, 199, 245, 265, 320, 321, Collings, Currier, Deegan, Kelly, Ross, Scherer
White hake <i>Urophycis tenuis</i>	11, 51, 74, 84, 103, 112, 183, 190, 191, 199, 245, 265, 320, 321, Currier, Deegan, Kelly, Ross, Scherer
Mummichogs <i>Fundulus heteroclitus</i>	2, 11, 51, 84, 103, 112, 183, 199, 245, Deegan, Currier, Kelly, Scherer
Silversides <i>Menidia</i> species	11, 51, 84, 94, 103, 112, 141, 183, 190, 191, 199, 245, Deegan, Currier, Kelly, Scherer
Fourspine stickleback <i>Apeltes quadratus</i>	11, 51, 84, 103, 112, 183, 199, 245, 439, 440, Currier, Deegan, Kelly
Threespine stickleback <i>Gasterosteus aculeatus</i>	11, 51, 84, 103, 112, 183, 199, 245, 439, 440, Currier, Deegan, Kelly
Ninespine stickleback <i>Pungitius pungitius</i>	11, 51, 84, 103, 112, 199, 439, 440, Currier, Kelly
Northern pipefish <i>Syngnathus fuscus</i>	11, 51, 84, 103, 112, 183, 199, 245, 248, Currier, Deegan, Kelly, Scherer
Northern searobin <i>Prionotus carolinus</i>	11, 51, 84, 89, 103, 112, 190, 191, 199, 245, 350, Collings, Currier, Deegan, Kelly, Scherer
Grubby <i>Myoxocephalus aeneus</i>	11, 51, 84, 89, 103, 112, 190, 191, 199, 245, 247, Collings, Currier, Deegan, Kelly, Scherer
Longhorn sculpin <i>Myoxocephalus octodecemspinosis</i>	11, 51, 84, 89, 103, 112, 190, 191, 199, 245, Collings, Currier, Deegan, Kelly, Scherer
Shorthorn sculpin <i>Myoxocephalus scorpius</i>	11, 51, 84, 89, 103, 112, 190, 191, 199, 245, Collings, Currier, Deegan, Kelly, Scherer
White perch <i>Morone americana</i>	11, 51, 84, 103, 112, 199, 245, 392, Brady, Currier, Kelly, Ross, Scherer
Striped bass <i>Morone saxatilis</i>	11, 51, 56, 84, 103, 112, 140, 199, 245, 243, 320, 321, Boreman, Brady, Currier, Deegan, Kelly, Ross, Scherer
Bluefish <i>Pomatomus saltatrix</i>	11, 51, 74, 84, 103, 112, 199, 243, 245, 320, 321, 327, Boreman, Currier, Deegan, Kelly, Ross, Scherer
Scup <i>Stenotomus chrysops</i>	11, 51, 74, 84, 103, 112, 190, 191, 183, 199, 245, 290, 320, 321, Collings, Currier, Deegan, Kelly, Scherer
Tautog <i>Tautoga onitis</i>	11, 29, 51, 74, 84, 89, 103, 112, 190, 191, 183, 199, 243, 245, 329, Collings, Currier, Deegan, Kelly, Lawton, Ross, Scherer
Cunner <i>Tautogolabrus adspersus</i>	11, 29, 51, 84, 89, 103, 112, 183, 190, 191, 199, 243, 245, Collings, Currier, Deegan, Kelly, Ross, Scherer
Ocean pout <i>Macrozoarces americanus</i>	11, 51, 74, 84, 103, 112, 190, 191, 199, 245, 320, 321, Currier, Deegan, Kelly, Scherer
Rock gunnel <i>Pholis gunnellus</i>	11, 51, 84, 89, 103, 112, 190, 191, 199, 245, 360, Collings, Currier, Deegan, Kelly, Scherer
American sandlance <i>Ammodytes americanus</i>	11, 30, 51, 84, 89, 103, 112, 183, 190, 191, 199, 245, 382, Currier, Deegan, Kelly, Scherer
Atlantic mackerel <i>Scomber scombrus</i>	11, 49, 51, 74, 84, 89, 91, 103, 112, 190, 191, 199, 245, 320, 321, 330, Collings, Currier, Deegan, Kelly, Ross, Scherer
Butterfish <i>Pepilus triacanthus</i>	11, 51, 74, 84, 89, 103, 112, 190, 191, 199, 245, 296, 320, 321, Currier, Deegan, Kelly, Ross, Scherer
Windowpane flounder <i>Scophthalmus aquosus</i>	11, 51, 74, 84, 89, 103, 112, 183, 190, 191, 199, 245, 320, 321, 410, Collings, Currier, Deegan, Kelly, Ross, Scherer
American plaice <i>Hippoglossoides platessoides</i>	11, 51, 74, 84, 103, 112, 190, 191, 199, 245, 89, 320, 321, Collings, Currier, Deegan, Kelly, Ross, Scherer
Winter flounder <i>Pleuronectes americanus</i>	11, 51, 63, 74, 84, 89, 103, 112, 183, 190, 191, 199, 245, 275, 320, 321, 342 Collings, Currier, Deegan, Kelly, Ross, Scherer
Yellowtail flounder <i>Pleuronectes ferrugineus</i>	11, 51, 74, 84, 89, 103, 112, 190, 191, 199, 245, 320, 321, 322, Collings, Currier, Deegan, Kelly, Lawton, Ross, Scherer
Smooth flounder <i>Pleuronectes putnami</i>	11, 51, 103, 112, 199, 370, Currier, Kelly, Scherer

Numbers correspond to references listed in Appendix 6, pp. 201-221.

Names correspond to individuals listed in Appendix 5, pp. 197-199.
